Limitations

The sale, hosting and/or distribution of this document in any and all forms, is prohibited.

Release from Liability

All users of this compilation must agree to be legally bound hereby, that Douglas R. Ranz ("Released Party") SHALL NOT BE LIABLE FOR MY DEATH OR INJURY TO MY PERSON, OR FOR ANY LOSS FOR DAMAGE TO MY PROPERTY OR REPUTATION caused in any manner whatsoever, whether attributable to the negligence of the Released Party, or for any other reason, occurring during the time that I am operating an aircraft.

I do hereby waive any right of action against the Released Party from any and all causes or claims that I may have against them from the beginning of time. I further agree not to sue on any such cause or claim. This agreement shall not release liability for gross negligence or willful misconduct of the Released Party. I agree to indemnify and hold the Released Party harmless for any losses, judgments, damages or fees he may incur, including but not limited to attorneys fees, arising out any lawsuit related to the planning, flight and/or enforcement of or legal challenge to this agreement. It is my intention that this agreement be interpreted and enforced to the maximum extent allowed by Michigan law.

GENERAL INFORMATION

1. GENERAL

A. The Supplement is a joint Civil/Military Flight Information Publication (FLIP), published and distributed every 8 weeks by the National Aeronautical Charting Office, FAA, Department of Transportation, Silver Spring, Maryland 20910. It is designed for use with the Flight Information Publication Enroute Charts, Alaska Terminal, USAF TACAN Charts covering Alaska and portions of Southwest and Northwest Canada, WAC and Sectional Aeronautical Charts.

B. This Supplement contains an Airport/Facility Directory of all airports shown on Enroute Charts, and those requested by appropriate agencies, communications data, navigational facilities, RADAR data, special notices and procedures applicable to the area of chart coverage. Military data of a more static or planning nature, is published in DoD Flight Information Publication AP/I Area Planning, North and South America.

C. The official ATC procedures for operating in the State of Alaska are the same as those in the conterminous United States, with a few exceptions, and are contained in the FAA Aeronautical Information Manual, Basic Flight Information and ATC Procedures.

D. Blank pages in this publication have been annotated "Intentionally left blank."

E. NEW OR CHANGED INFORMATION —To alert users of new information or changes to information from the previous issue, a vertical line will be portrayed to the left and extending the full length of the new and/or revised data. This will not apply to the front cover nor the airport/facility directory listings.

CORRECTIONS, COMMENTS, AND/OR PROCUREMENT CIVIL

CRITICAL information such as equipment malfunction, abnormal field conditions, hazards to flight, etc., should be reported as soon as possible to the nearest FAA facility, either in person or by reverse charge telephone call.

FOR AIRPORT SUPPLEMENT REVISIONS FORM VISIT WEB SITE: <http://nfdc.faa.gov/portal/airportchanges.do>

FAA, Aeronautical Information Services, ATO—R, Room 626
800 Independence Ave. S.W.
Washington, D.C. 20591
Telephone 1–866–295–8236
Fax 202–267–5322
Email 9–AT0R–HQ–AIS–AIRPORTCHANGES@FAA.GOV

NOTICE: Changes must be received by the Aeronautical Information Services as soon as possible but not later than the "cut-off" dates listed below to assure publication on the desired effective date.

	Airport Information	Airspace Information*
Effective Date	Cut-off date	Cut-off date
17 Dec 09	4 Nov 09	15 Oct 09
11 Feb 10	30 Dec 09	10 Dec 09
8 Apr 10	24 Feb 10	4 Feb 10
3 Jun 10	21 Apr 10	1 Apr 10
29 Jul 10	16 Jun 10	27 May 10
23 Sep 10	11 Aug 10	22 Jul 10

*Including changes to preferred routes and graphic depictions on charts.

PROCURE FROM:

FAA, National Aeronautical Charting Office
Distribution Division, ATO—W
10201 Good Luck Road
Glenn Dale, MD 20769–9700
Online at www.naco.faa.gov
Email 9–AMC–Chartsales@faa.gov
Telephone 1–800–638–8972
FAX 301–436–6829
or any authorized FAA Chart Agent.

MILITARY

For Corrections Information, See Chapter 11 of General Planning (GP). For Procurement refer to DOD Catalog of Aeronautical Charts and Flight Information Publications.

THIS PUBLICATION COMPRISES PART OF THE FOLLOWING SECTIONS OF THE UNITED STATES AERONAUTICAL INFORMATION PUBLICATION (AIP): GEN, AGA 3, COM 2.

NOTE: AERONAUTICAL INFORMATION MANUAL, BASIC FLIGHT INFORMATION AND ATC PROCEDURES

Civil pilots are urged to use the FAA Aeronautical Information Manual (AIM), Basic Flight Information and ATC Procedures to complement the operational data contained in the Alaska Supplement. The AIM contains information on the basic fundamentals required to fly in the U.S. National Airspace System which are not necessarily repeated within this Supplement. Representative of data contained consists of a Pilot/Controller Glossary; descriptions of Radio Aids to Navigation; Airspace, Air Traffic Control information involving services, rules, regulations, flight procedures, and emergency procedures; Safety of flight concerning weather, Medical Facts for Pilots and Good Operating Practices.

4 AIRPORT/FACILITY DIRECTORY LEGEND

① NOTAM SYMBOLLOGY DEFINITIONS

Facilities covered by the FAA/DoD integrated NOTAM system shall be indicated by the appropriate symbols immediately preceding the facility name, as follows.

DoD NOTAM SERVICE—NOTAM information for DoD aircrews is obtained using the DoD Internet NOTAM System (DINS) which is derived from the United States Consolidated NOTAM Office at the FAA Air Traffic Control Systems Command Center, Herndon, VA.

PRIMARY—The Primary DINS system NOTAM web page <https://WWW.NOTAMS.JCS.MIL> incorporates many features to assist the user when retrieving NOTAM requests. Real time NOTAM data is available and contains all NOTAMs validated by the U.S. NOTAM System (USNS), which includes domestic, international, military and from Flight Data Centers (FDC). DINS will provide a plain language notice, highlighted in red, when a requested location is not in the U.S. NOTAM System. If the requested location is not covered, it does not transmit locally to receive NOTAM information to the USNS. You must contact the requested location to receive NOTAM information.

ALTERNATE LOCATION—Use WWW.NOTAMS.FAA.GOV to retrieve NOTAMs should the primary DINS server be out of service.

§ Facility is covered by civil NOTAMs

All aircrews should consult FAA NOTICES TO AIRMEN. Aircrews filing to airports not covered by the FAA/DoD integrated NOTAM system should contact the nearest FAA FSS.

② **CITY/AIRPORT NAME** — Civil and civil-military airports are listed alphabetically by official city reference. Where the city name is different from the airport name the city name will appear on the line above the airport name. Multiple airports referenced to the same city are listed alphabetically by airport name separated by a dashed rule line. All others will be separated by a solid rule line. Military airports are listed alphabetically by official airport name.

③ **ALTERNATE OR CITY NAME**

④ **AIRPORT IDENTIFIERS AND ICAO LOCATION INDICATORS** — The airport identifier is shown by a three or four character code in parentheses. The ICAO location indicator, when assigned, will be published in parentheses immediately following the airport identifier. Zeros will appear with a slash to differentiate them from the letter 'O'.

⑤ **AIRPORT LOCATION** — Location is given in nautical miles (to the nearest tenth mile) and direction from center of referenced city.

⑥ **GEOGRAPHIC POSITION OF AIRPORT—AIRPORT REFERENCE POINT (ARP)** — Positions are shown in degrees, minutes and hundredths of a minute and represent the approximate geometric center of all usable runway surfaces.

⑦ **AIRPORT OF ENTRY (AOE), LANDING RIGHTS ARPT (LRA), AND CUSTOMS USER FEE AIRPORTS.**

U. S. CUSTOMS USER FEE AIRPORT—Private aircraft operators are frequently required to pay the costs associated with customs processing.

US Customs Air and Sea Ports, Inspectors and Agents
Pacific Sector (WA, OR, CA, HI and AK) 407-975-1800

⑧ **TIME CONVERSION** — Hours of operation of all facilities are expressed in Coordinated Universal Time (UTC) and shown as "Z" time. The supplement indicates the number of hours to be subtracted from UTC to obtain local standard time and local daylight saving time (DT); e.g., UTC-9(-8DT). The symbol ‡ indicates that during periods of daylight saving time, effective hours will be one hour earlier than shown. Where the location does not observe daylight saving time, or the area is constantly on daylight saving time, the listing shall indicate the UTC local time conversion factor only; e.g., UTC-9.

⑨ **CHARTS** — Refer to the Sectional Chart, Alaska Low and High Altitude Enroute chart and panel on which the airport or facility is located.

⑩ **INSTRUMENT APPROACH PROCEDURE, AIRPORT DIAGRAM** — The letters IAP indicate an airport for which a prescribed (Public-Use) FAA Instrument Approach Procedure has been published. DIAP indicates an airport for which a prescribed DoD Instrument Approach Procedure has been published in the U.S. Terminal Procedures Publication. See Section C, General Notices portion of this directory, Civil Use of Military Fields and the Aeronautical Information Manual 5-4-5 Instrument Approach Procedure Charts for additional information. AD indicates an airport for which an airport diagram has been published in Section G. Airport diagrams are listed alphabetically by associated city and airport name.

⑪ **AIRPORT SKETCH** — When provided depicts the airport and related topographical information as seen from the air and should be used in conjunction with the text. It is intended as a guide for pilots in VFR conditions. Symbolology that is not self-explanatory will be reflected in the sketch legend. The airport will be oriented with True North at the top.

(12) AIRPORT CLASSIFICATION — Airports within the directory are classified into two basic categories, e.g., (1) Military/Federal Government, and (2) Civil airports open to the general public, plus some selected private airports. To readily identify the type of airport, an abbreviation as listed below appears beneath the airport name.

MILITARY/FEDERAL GOVERNMENT

A	—	US Army	FAA	—	Federal Aviation Administration
AF	—	US Air Force	MC	—	US Marine Corps
ANG	—	US Air National Guard	MOT	—	Ministry of Transport, Canada
AR	—	US Army Reserve, normally limited operating facilities	N	—	US Navy
AS	—	Air Station	NG	—	US Army National Guard
CG	—	US Coast Guard	NMFS	—	National Marine Fisheries Service
DND	—	Department of National Defense Canada	USFS	—	US Forest Service

CIVIL

P — Civil Airport wherein permit covers use by transient Military Aircraft. When Military/Federal Government is a **tenant** on the airport, abbreviations will be enclosed in parentheses (see sample Legend).

PVT — Private Use Only (Closed to the Public). Military pilots are reminded they may be subjected to landing fees at these airports if no agreement exists for military use.

NO CLASSIFICATION — Indicates the airport is open to the General Public. For military use, arrangements must be made with the airport manager. USAF/USN pilots may use these airports for official business only upon approval of major Command/Operational Commander. U. S. Army Pilots refer to AR-95-1.

(13) AIRPORT ELEVATION — The highest point of an airport's usable runways measured in feet from mean sea level. When elevation is sea level it will be indicated as (00). When elevation is below sea level a minus (–) sign will precede the figure.

(14) LIGHTING — (Specific lighting facilities available are indicated by following code.)

B — Rotating Light (Rotating beacon) (includes flashing white; green and white; split-beam and other types). Omission of B indicates beacon is not available. At civil airports, omission may indicate that beacon does not operate standard hours (sunset-sunrise).

L — by itself indicates temporary lighting such as flares, smudge pots, lanterns.

—1 Portable lights (Electrical)	—8 Sequenced Flashing lights
—2 Boundary lights	—9 Visual Approach Slope Indicator Systems
—3 Runway floods	—10 Runway End Identifier Lights (REIL)
—4 Runway or strip	—11 Runway Centerline lights
—5 Approach lights	—12 Precision Approach Path Indicator (PAPI)
—6 High intensity runway lights	—13 Optical Landing System (OLS)
—7 High intensity approach lights	

* An asterisk preceding an element indicates that it operates on request only (by phone call, telegram or letter, or radio). Where the asterisk is not shown the lights are in operation sunset to sunrise.

NOTE: Obstructions are usually lighted in accordance with both Federal Air Regulations and military regulations; therefore, they have not been included as a part of the above code. If, however, information indicates there are unlighted obstructions surrounding the airport this will be indicated in remarks column.

NOTE: When runway edge lights are positioned more than 10 ft. from the edge of the usable runway surface a CAUTION note will be included in the airport remarks. This is applicable to Air Force, Air National Guard, Air Force Reserve Bases, and those joint use airfield on which they are tenant.

NOTE: Civil ALSF-2 may be operated as SSALR during favorable weather conditions.

PILOT CONTROL OF AIRPORT LIGHTING

Key Mike	Function
7 times within 5 seconds	Highest intensity available
5 times within 5 seconds	Medium or lower intensity (Lower REIL or REIL-Off)
3 times within 5 seconds	Lowest intensity available (Lower REIL or REIL-Off)

Available systems will be indicated in the Airport Remarks, as follows:

ACTIVATE MALSR Rwy 07, HIRL Rwy 07-25-122.8.

or

ACTIVATE MIRL Rwy 18-36-122.8.

or

ACTIVATE VASI and REIL, Rwy 07-122.8.

Where the airport is not served by an instrument approach procedure and/or has an independent type system of different specification installed by the airport sponsor, descriptions of the type lights, method of control, and operating frequency will be explained in clear text. For a detailed description of pilot control of airport lighting, CIVIL - See AIM "Basic Flight Information and ATC Procedures" and MILITARY - See "Flight Information Handbook".

Airports having other than FAA approved systems, the remarks will indicate the type of lights, method of control, and operating frequency in clear text.

6 AIRPORT/FACILITY DIRECTORY LEGEND

15 RUNWAY DATA — GENERAL: Runway surface material is classified as either Hard or Other. A hard surface is considered to be permanent and requires little maintenance. The letter H precedes the length figure at airports considered to have hard surface runways. Absence of an H means other than hard surface. The surface material is shown in parentheses following the runway length and is the visible material or composition of the major landing portion of the runway.

LENGTH: Runway length shall be the actual length of the longest runway (pavement, end to end) including displaced thresholds, but excluding those areas designated as overruns. The length is shown to the nearest hundreds of feet (add 00). 70 shall be the division point, e.g., 10769 feet equals 107. 10770 feet equals 108. Length for landing and takeoff shall be clarified in the Airport Remarks Section.

SURFACE:

- HARD** — (ASP) Asphalt. Hot or cold laid plant mixes of asphalt cement with graded crushed aggregate. Includes stone rolled to form a smooth hard surface and bound with a permanent bitumen binder.
(BED ROCK)
(BRICK) Laid and mortared
(CON) Concrete: Stone, sand, cement and water mixture.
- OTHER** — (BITUMEN) A coal tar or petroleum product binding, usually with sand and/or gravel. (Do not confuse with bitumen bound macadam.)
(MACADAM) Crushed stone rolled to form a smooth, hard surface and bound with a temporary binder such as clay, earth, etc.

(CINDERS)	(SAND)	(AFSC) Aggregate Friction seal coat
(CLAY)	(SILT)	(GRVD) Grooved
(COAL)	(SOD)	(PFC) Porous friction courses
(EARTH)	(TUNDRA)	(RFSC) Rubberized friction seal coat
(GRASS)	(TURF)	(TRTD) Treated
(GVL) Gravel	(PSP) Pierced steel plank	(WC) Wire combed
(LIMESTONE)	(VOLCANIC ASH)	(UNK) Surface material unknown

16 RUNWAY WEIGHT BEARING CAPACITY — Runway strength data shown in this publication is derived from available information and is a realistic estimate of capability at an average level of activity. It is not intended as a maximum allowable weight or as an operating limitation. Many airport pavements are capable of supporting limited operations with gross weights in excess of the published figures. Permissible operating weights, insofar as runway strengths are concerned, are a matter of agreement between the owner and user. When desiring to operate into any airport at weights in excess of those published in this publication, users should contact the airport management for permission. Runway strength figures are shown in thousand of pounds, with the last three figures being omitted. Add 000 to figure following S, D, 2S, 2T, AUW, SWL, etc., for gross weight capacity. A blank space following the letter designator is used to indicate the runway can sustain aircraft with this type landing gear, although definite runway weight bearing capacity figures are not available, e.g., S, D. Applicable codes for typical gear configurations with S=Single, D=Dual, T=Triple and Q=Quadraple:

CURRENT	NEW	NEW DESCRIPTION
S	S	Single wheel type landing gear (DC3), (C47), (F15), etc.
D	D	Dual wheel type landing gear (BE1900, (B737), A319), etc.
T	D	Dual wheel type landing gear. (P3, C9).
ST	2S	Two single wheels in tandem type landing gear (C130).
TRT	2T	Two triple wheels in tandem type landing gear (C17), etc.
DT	2D	Two dual wheels in tandem type landing gear (B707), etc.
TT	2D	Two dual wheels in tandem type landing gear (B757, KC135).
SBTT	2D/D1	Two dual wheels in tandem/dual wheel body gear type landing gear (KC10).
None	2D/2D1	Two dual wheels in tandem/two dual wheels in tandem body gear type landing gear (A340-600).
DDT	2D/2D2	Two dual wheels in tandem/two dual wheels in double tandem body gear type landing gear (B747, E4).
TTT	3D	Three dual wheels in tandem type landing gear (B777), etc.
TT	D2	Dual wheel gear two struts per side main gear type landing gear (B52).
TDT	C5	Complex dual wheel and quadraple wheel combination landing gear (C5.)

AUW — All up weight. Maximum weight bearing capacity for any aircraft irrespective of landing gear configuration.

SWL — Single Wheel Loading. (This includes information submitted in terms of Equivalent Single Wheel Loading (ESWL) and Single Isolated Wheel Loading).

PSI — Pounds per square inch. PSI is the actual figure expressing maximum pounds per square inch runway will support, e.g., (SWL 000/PSI 535).

C54, etc. —Aircraft by type based on past usage when more specific information is not known,

NOTE: Omission of weight bearing capacity indicates information unknown.

The ACN/PCN System is the ICAO method of reporting pavement strength for pavements with bearing strengths greater than 12,500 pounds. The Pavement Classification Number (PCN) is established by an engineering assessment of the runway. The PCN is for use in conjunction with an Aircraft Classification Number (ACN). Consult the Aircraft Flight Manual, Flight Information Handbook, or other appropriate source for ACN tables or charts. Currently, ACN data may not be available for all aircraft. If an ACN table or chart is available, the ACN can be calculated by taking into account the aircraft weight, the pavement type, and the subgrade category. For runways that have been evaluated under the ACN/PCN system, the PCN will be shown as a five part code (e.g., PCN 80 R/B/W/T). Details of the coded format are as follows:

(1) The PCN NUMBER—The reported PCN indicates that an aircraft with an ACN equal or less than the reported PCN can operate on the pavement subject to any limitation on the tire pressure.

(2) The type of pavement:

- R — Rigid
- F — Flexible

(3) The pavement subgrade category:

- A — High
- B — Medium
- C — Low
- D — Ultra-low

(4) The maximum tire pressure authorized for the pavement:

- W — High, no limit
- X — Medium, limited to 217 psi
- Y — Low, limited to 145 psi
- Z — Very low, limited to 73 psi

(5) Pavement evaluation method:

- T — Technical evaluation
- U — By experience of aircraft using the pavement

NOTE: Prior permission from the airport controlling authority is required when the ACN of the aircraft exceeds the published PCN or aircraft tire pressure exceeds the published limits.

17 SERVICING (CIVIL CODE)

- S1: Minor airframe repairs.
- S2: Minor airframe and minor powerplant repairs.
- S3: Major airframe and minor powerplant repairs.
- S4: Major airframe and major powerplant repairs.

NOTE: While Jet Starter units are available at a number of Civil Airports, it remains the responsibility of the individual and/or company to make sure that this service will be available.

SERVICING (MILITARY)

Specific services available are listed individually under each airport listing, i.e., fuel, oil, JASU, etc. Times of transient alert service availability are given in the Airport Remarks. Transient alert service is considered to include all services for TURN-AROUND, i.e., servicing (Fuel, oil, oxygen, etc.), debriefing to determine requirements for maintenance, minor maintenance, inspection and parking assistance of transient aircraft. Drag chute repack, specialized maintenance, or extensive repairs will be provided within the capabilities and priorities of the base. Delays can be anticipated after normal duty hours/holidays/weekends regardless of the hours of transient maintenance operation. Pilots should not expect aircraft to be serviced for turn-arounds during time periods when servicing or maintenance manpower is not available. In case of airports not operated exclusively by U.S. military, the servicing indicated will not always be available for U.S. military aircraft. When transient alert services are not shown, facilities are unknown.

NO PRIORITY BASIS — Means that transient alert services will be provided only after all the requirements for mission/tactical assigned aircraft have been accomplished.

NOTE: BASES MAY BE USED AT ANY TIME AS WEATHER ALTERNATES OR IN CASE OF EMERGENCY.

18 JET AIRCRAFT STARTING UNITS (JASU) — The numeral preceding the type of unit indicates the number of units available. The absence of the numeral indicates 10 or more units available. Absence of JASU designation indicates non-availability.

USAF JASU (For variations in technical data, refer to T.O. 35-1-7).

Electrical Starting Units:

AF/M32A-10	AC: 115/208V, 400 cycle, 3 phase, 20 KVA, 0.75 PF, 4 wire DC: 28V, 500 AMP, 15 KW
A/M32A-86	AC: 115/200V, 3 phase, 90 KVA, 0.8 PF, 4 wire DC: 28V, 1500 AMP, 72 KW (with TR pack)
C-26B	AC: 115/208V, 380-800 cycles, 1 phase, 15 KVA, 131 AMP, 2 wire DC: 28V, 1500 AMP, 45 KW
MC-1A	AC: 115/208V, 400 cycle, 3 phase, 37.5 KVA, 0.8 PF, 108 AMP, 4 wire DC: 28V, 500 AMP, 14 KW

(19) US AVIATION FUELS (MIL SPECS)/COMMERCIAL AVIATION FUELS — At joint use airports bold type in directory listing denotes the availability of U.S. military base supply fuel while into-plane contract fuel is shown in light type. Listing preceded by NC (no military contract) identifies open market aviation fuel. Where codes are not assigned, fuel will be published as indicated in grade class.

FLIP CODE	GRADE	NATO CODE
80	(80/87 Mil spec) Grade 80 Gasoline (Red)	F—12
100	Grade 100 Gasoline (Green)	None
100LL	(100/130 Mil spec) Grade 100 Gasoline Low Lead (Blue)	F—18
115	(115/145 Mil spec) (Purple)	F—22
A	Jet A, Kerosene, without FS—II*, FP** minus 40°C	None
A+	Jet A, Kerosene, with FS—II*, FP** minus 40°C	None
A1	Jet A—1, Kerosene without FS—II*, FP** minus 47°C	F—35
A1+	Jet A—1, Kerosene, with FS—II*, FP** minus 47°C	F—34
B	Jet B, Wide Cut, Turbine Fuel without FS—II*, FP** minus 50°C	None
B +	Jet B, Wide Cut Turbine Fuel with FS—II*, FP** minus 50°C	None
J4	(JP—4 Mil spec) FP** minus 58°C	F—40
J5	(JP—5 Mil spec) FP** minus 46°C	F—44
J8	(JP—8 Mil spec) Jet A—1, Kerosene with FS—II, FP** minus 47°C	F—34
J8+100	(JP—8 Mil spec) Jet A—1, Kerosene with FS—II (Fuel System Icing Inhibitor), FP (Freeze Point) minus 47°C, with fuel additive package that improves thermo stability characteristics of JP—8.	None
J	(Jet Fuel, Type unknown)	
MOGAS	Automobile gasoline which is to be used as aircraft fuel	None
*(Fuel System Icing Inhibitor)		
**(Freeze Point)		

NOTE: Data shown on fuel availability represents the most recent information the publisher has been able to acquire. Because of a variety of factors, the fuels listed may not always be obtainable by transient civil pilots. Confirmation of availability of fuel should be made directly with fuel dispensers at locations where refueling is planned.

MILITARY: Where contract fuel is available, the name of the refueling agent is shown footnoted in airport remarks. Military fuel should be used first if it is available. When military fuel cannot be obtained but contract fuel is available, Government aircraft should refuel with contract fuel to avoid potential contract disputes with into-plane contractors. When fuel or oil is obtained from commercial sources, the crew member who signs for the product will ensure that quantity shown on the issue document actually has been received. If the contractor/fueling agent insists on using his own commercial delivery form or other form ie: AF Form 15, SF44, etc., in addition to the DD Form 1898, the pilot/crew chief is responsible for annotating the form utilized with the statement "Duplicate-DD Form 1898 accomplished." Should there be any question as to whether a contract exists at an individual aerodrome location, DESC-OD DLA Headquarters, Ft. Belvoir, Va., can be contacted by message or telephone at: 1-800 2 TOP OFF (1-800-286-7633).

The U.S. Government National Credit Card (SF 149) is not a valid instrument to obtain fuel under a DFSC Into-Plane Contract. The U.S. Military Aircraft Identaplates DD Form 1896 (Jet Fuel) and DD Form 1897 (Avgas) and Af Form 1245 (Avgas) are the only acceptable plates for use in documenting into-plane contract fuel purchases.

US AVIATION OILS (MIL SPECS)

FLIP/NATO CODE	GRADE, TYPE
0—113	1065, Reciprocating Engine Oil (MIL—L—6082)
0—117	1100, Reciprocating Engine Oil (MIL—L—6082)
0—117 +	1100, 0—117 plus Cyclohexanone (MIL—L—6082)
0—123	D—1065 (Dispersant), Reciprocating Engine Oil (MIL—L—22851 Type III)

0—156	None, MIL—L—23699 (Synthetic Base) Turboprop and Turboshaft Engines.

SUPPORTING FLUIDS AND SYSTEMS

ADI	Anti-Detonation Injection Fluid—Reciprocating Engine Aircraft
De-Ice	T—33 De-Icing Fluid (MIL—A—6091)
JOAP/SOAP	Joint Oil Analysis Program. JOAP support is furnished during normal duty hours, other times on request. (JOAP and SOAP (Spectrometric Oil Analysis Program) programs provide essentially the same service, JOAP is now the standard joint service supported program.)
PRESAIR	Air Compressors rated 3,000 PSI or More
SP	Single Point Refueling
W	Water, Thrust Augmentation —Jet Aircraft
WAI	Water-Alcohol Injection Type, Thrust Augmentation —Jet Airport

10 AIRPORT/FACILITY DIRECTORY LEGEND

20 OXYGEN (MILITARY)

LPOX	—	Low pressure oxygen servicing.	OXRB	—	Oxygen replacement bottles.
HPOX	—	High pressure oxygen servicing.			(Maintained primarily at Naval
LHOX	—	Low and High pressure oxygen servicing.			stations for use in aircraft where
					oxygen can be replenished only
LOX	—	Liquid oxygen servicing.			by replacement of cylinders.)

NOTE: Combination of above terms is used to indicate complete oxygen servicing available, i.e., LHOX and RB-Low and RB-High pressure oxygen servicing and replacement bottles; LPOX-RB only—Low pressure oxygen replacement bottles only, etc.

NOTE: Aircraft will be serviced with oxygen procured under military specifications only. Aircraft will not be serviced with medical oxygen.

NITROGEN

LPNIT—Low pressure nitrogen servicing.

HPNIT—High pressure nitrogen servicing.

LHNIT—Low and high pressure nitrogen servicing.

NIT—Indicates nitrogen servicing when type of servicing is unknown.

21 ARRESTING GEAR SYSTEM

US SYSTEMS

REFER TO CURRENT AIRCRAFT OPERATING MANUALS FOR SPECIFIC ENGAGEMENT WEIGHT AND SPEED CRITERIA BASED ON AIRCRAFT STRUCTURAL RESTRICTIONS AND ARRESTING SYSTEM LIMITATIONS.

NOTE: Airport listings may show availability of other than U.S. military arresting systems. This information is provided for emergency requirements only.

CABLE

Following is a list of current tail hook systems identified by both Air Force and Navy terminology:

BI—DIRECTIONAL (B)		M—21 rotary hydraulic operational arrestor, short runout 700'.
AIR FORCE	NAVY	
BAK—6		Water Squeezer
BAK—9		Rotary Friction Brake
BAK—12		Rotary Friction Brake
	M—21	Rotary hydraulic operational arrestor, short runout 700'
BAK—13	E—28	Rotary hydraulic
MB100		Textile Brake—An emergency one-time use, modular braking system employing the tearing of specially woven straps to absorb the kinetic energy.
UNI—DIRECTIONAL		
_____	E5/E5—1/ E5—3	Chain type. At USN/USMC air stations E-5 A-Gear is rated; e.g., E-5 Rating—13R-1100 HW (DRY), 31L/R-1200 STD (WET). This rating is a function of the A-Gear chain weight and length and is used to determine the maximum aircraft engaging speed. A dry rating applies to a stabilized surface (dry or wet) while a wet rating takes into account the amount (if any) of wet overrun that is not capable of withstanding the aircraft weight. These ratings are published under AIRPORT REMARKS.
MB60		Textile Brake—An emergency one-time use, modular braking system employing the tearing of specially woven straps to absorb the kinetic energy.

BARRIER/CABLE

Uni—Directional		
MA—1A		Web barrier between stanchions attached to a chain energy absorber. Designed primarily for main strut engagement but tests reveal successful hook back—up capability.
BAK—15 (61QS II)		Web barrier between stanchions attached to an energy absorber (water squeezer, rotary friction, chain). Designed for wing engagement.
BAK—15 (NI)		Web barrier between stanchions interconnected with a hook pickup cable and energy absorber. System is call BAK—15 with Net Interconnect (NI).

CAUTION: Landing short of the runway threshold on a runway with a BAK—15 in the underrun is a significant hazard. The barrier in the down position still protrudes several inches above the underrun. Aircraft contact with the barrier short of the runway threshold can cause damage to the barrier and substantial damage to the aircraft.

The following arresting systems are designed for main strut arrestments and modified with an extra pick up cable for hook arrestment if desired.

Uni—Directional		
MA—1A modified		Web barrier between adjustable stanchions combined with
or MA—1A/E—5		a hook pick up cable and chain energy absorber.
MA—1A/BAK—9,		Web barrier between adjustable stanchions combined with
BAK—12		a hook pick up cable and a mechanical energy absorber.

The following devices are used in conjunction with some aircraft arresting systems:

- BAK—11 Pop up engaging device with a mechanical energy absorber (BAK—9, BAK—12) to engage main landings struts.
- BAK—14 A device that raises a hook cable out of a slot in the runway surface and is remotely positioned for engagement by the tower on request. (In addition to personnel reaction time, the systems requires up to 5 seconds to fully raise the cable).

LOCATION OF GEAR: The arresting gear is depicted as it is located on the runway. The middle portion of the runway is indicated by a dash —, and the A—Gear distance from the end of the appropriate runway (or into the overrun) is indicated in parentheses. Arresting gear which has a bi-directional capability and can be utilized for emergency approach end engagements is indicated by a (B). See example A. NOTE—Up to 15 minutes advance notice may be required for rigging A—Gear for approach end engagement. Direction of engagement of E5/E5—1 chain type gear as indicated by an arrow i.e., ←E5—1. See example B.

A—GEAR

(Example A)

(Example B)

OTHER TYPE

DESCRIPTION

EMAS

Engineered Material Arresting System, located beyond the departure end of the runway, consisting of high energy absorbing materials which will crush under the weight of an aircraft.

22 LAND AND HOLD SHORT OPERATIONS (LAHSO)

LAHSO is an acronym for "Land and Hold Short Operations." These operations include landing and holding short of an intersection runway, an intersecting taxiway, or other predetermined points on the runway other than a runway or taxiway. Measured distance represents the available landing distance on the landing runway, in feet.

Specific questions regarding these distances should be referred to the air traffic manager of the facility concerned. The Aeronautical Information Manual contains specific details on hold short operations and markings.

23 RUNWAY DECLARED DISTANCE INFORMATION

TORA—Take-off Run Available. The length of runway declared available and suitable for the ground run of an aeroplane take-off.

TODA—Take-off Distance Available. The length of the take-off run available plus the length of the clearway, if provided.

ASDA—Accelerate Stop Distance Available. The length of the take-off run available plus the length of the stopway if provided.

LDA—Landing Distance Available. The length of runway which is declared available and suitable for the ground run of an aeroplane landing.

24 AIRPORT REMARKS

I. GENERAL: Pertinent Airport Remarks have been grouped in order of applicability. The first group of remarks is applicable to the primary operator of the airport. Remarks applicable to an activity or activities on the airport are shown on separate lines, i.e., (A) (AF) (N) (ANG) (CIVIL), etc. Restrictions affecting the operational status of the airports are the first entry within each group.

II. AIRPORT ATTENDANCE: Airport attendance does not mean watchman duties or telephone accessibility, but rather an attendant or operator on duty to provide at least minimum services (e.g., lights, fuel, transportation).

III. CRITERIA: Airport Remarks are limited to those items of information determined essential for operational use and are outlined below under paragraph A. Another list (paragraph B) is also shown to indicate the type of data that normally is not published. Remarks received for publication which are not in accordance with paragraph "A" will not be published. If a special need exists for publication of data not covered in this list, the appropriate authority should forward their request to the office listed in the general information section with full justification of their operational need.

A. Remarks are limited to those items that fall within the following criteria:

1. Conditions of a permanent or indefinite (more than 30 days) nature, regarding aeronautical facilities, services to include transient alert service available to aircraft, procedures, or hazards, knowledge of which is essential for safe and efficient operation of aircraft.
2. Obstructions to aircraft operations on or near the airport/seaplane/heliport landing area.
3. Occurrence or correction of defects or changes in the landing or operating area.
4. Caution notes relating to extensive aircraft maneuvers at military facilities, which may affect air navigation, i.e., flight training, aircraft testing, flights of uncontrolled or unmanned aircraft.
5. Traffic pattern data for those USAF, USN and US Army bases (including those on which the USAF or US Army is a tenant) that deviate from the standard.
6. Heliport approach and departure directions, traffic/holding pattern altitudes.
7. Special VFR arrival procedures (these may be included in their entirety or by reference to the actual location in the FLIP).
8. Customs facilities, seasonal availability, Naval airfield category.
9. When the appropriate authority authorizes the use of overruns for take-off purposes, a note to this effect may be shown.
10. Airports serving Department of Transportation certified carriers and certified under 14 CFR part 139 are indicated by the Class and the ARFF Index; e.g. Class I, ARFF Index A, which relates to the availability of crash, fire, rescue equipment. Class I airport can have an ARFF Index A through E, depending on the aircraft length and scheduled departures. Class II, III, and IV will always carry an Index A.

12 AIRPORT/FACILITY DIRECTORY LEGEND

14 CFR PART 139 CERTIFICATED AIRPORTS AIRPORT CLASSIFICATIONS

Type of Air Carrier Operation	Class I	Class II	Class III	Class IV
Scheduled Air Carrier Aircraft with 31 or more passenger seats	X			
Unscheduled Air Carrier Aircraft with 31 or more passenger seats	X	X		X
Schedule Air Carrier Aircraft with 10 to 30 passenger seats	X	X	X	

14 CFR—PART 139 CERTIFICATED AIRPORTS

INDICES AND AIRCRAFT RESCUE AND FIRE FIGHTING EQUIPMENT REQUIREMENTS

Airport Index	Required No. Vehicles	Aircraft Length	Scheduled Departures	Agent + Water for Foam
A	1	<90'	≥1	500#DC or HALON 1211 or 450#DC + 100 gal H ₂ O
B	1 or 2	≥90', <126'	≥5	Index A + 1500 gal H ₂ O
C	2 or 3	≥126', <159'	<5	Index A + 3000 gal H ₂ O
D	3	≥159', <200'	≥5	Index A + 4000 gal H ₂ O
E	3	≥200'	<5	Index A + 6000 gal H ₂ O

> Greater Than; < Less Than; ≥ Equal or Greater Than; ≤ Equal or Less Than; H₂O—Water; DC—Dry Chemical.

NOTE: The listing of ARFF index does not necessarily assure coverage for non-air carrier operations or at other than prescribed times for air carrier. ARFF index Ltd.—indicates ARFF coverage may or may not be available, for information contact airport manager prior to flight.

11. Footnotes — Circled numerals are used to footnote data to the **Remarks** section, e.g., ①, ②, etc.
B. The following type data is not normally published.

- Any condition which is expected to remain in effect for less than 30 days. This type data includes: Presence or removal of hazardous conditions due to snow, ice, water, or temporary obstructions on or adjacent to the landing area, remarks such as, "runway slippery when wet, do not use runway (Number) or taxi-way", etc.
- Data regarding IFR arrival and departure procedures.
- Temporary shortages of certain types of fuel, starting equipment or other aircraft services.
- Information concerning permanent closing of a runway.
- Data regarding closures or restrictions at stations due to air shows, close proximity to athletic events, etc.
- Data regarding availability of box lunches, hotel reservations, government transportation, billeting, VIP arrivals, etc.
- Instructions as to how to fly the VFR traffic pattern.
- Instructions for ground control and/or ground handling of aircraft.

IV. AIRPORT RESTRICTIONS:

- A. **CLOSED (CLSD):** When designated closed, the airport is restricted from use by all aircraft unless stated otherwise. Any closure applying to specific type of aircraft or operation will be so stated. USN/USMC/USAF airports are considered closed during non-operating hours. Closed airports may be utilized during emergency provided there is a safe landing area.
- B. **OFFICIAL BUSINESS ONLY (OFFL BUS ONLY):** The airport is closed to all transient aircraft that do not have official business at or near the installation concerned. USAF aircraft require written orders. Official business within the meaning of AFI 13-213 and OPNAVINST 3721.1 is further defined as the necessity for personnel aboard the aircraft to contact personnel or units (including civilian) at or near the airport concerned. This definition does not provide for routine transient aircraft operations such as obtaining clearances or servicing unless required by operations in overseas areas.
- C. **AF OFFL BUS ONLY OR NAVY OFFL BUS ONLY:** Indicates that the restriction applies only to service indicated.
- D. **PRIOR PERMISSION REQUIRED (PPR):** Airport is closed to transient aircraft unless approval for operation is obtained from the appropriate commander through Chief, Airfield Management or Airfield Operations Officer. PPR must be requested and confirmation received before the flight departs to that airfield. The purpose of PPR is to control volume and flow of traffic rather than to prohibit it. Even though not annotated in the Airport Remarks, prior permission is required for all aircraft requiring transient alert service outside the published transient alert duty hours. All aircraft carrying hazardous materials must obtain prior permission as outlined in AFJI 11-204, AR 95-27, OPNAVINST 3710.71C.

NOTE: Official Business Only and PPR restrictions are not applicable to Special Air Mission (SAM) aircraft providing person or persons aboard are designated Code 6 or higher as explained in AFJMAN 11-213, AR 95-11, OPNAVINST 3722.8J. Official Business Only or PPR do not preclude DoD acft the use of the airport as an alternate for IFR flight.

(25) WEATHER DATA SOURCES — The following weather related reporting systems will be listed under Weather Data Sources:

1. Automated Weather Observing System (AWOS) consists of various sensors, a processor, a voice synthesizer, and transmitter to relay local real-time weather data directly to the pilot. These systems are classified into four basic levels:
 AWOS—A—reports altimeter setting. (Any other information is advisory only).
 AWOS—1 reports altimeter setting, wind data and usually temperature, dewpoint and density altitude.
 AWOS—2 reports the same as AWOS—1 plus visibility.
 AWOS—3 reports the same as AWOS—1 plus visibility and cloud/ceiling data.
2. ASOS—Automated Surface Observing System reports the same as an AWOS—3 plus precipitation identification and intensity, and freezing rain occurrence (future enhancement).
3. Supplemental Aviation Weather Reporting Station (SAWRS) – identifies airports that have supplemental aviation weather available to pilots.
4. Pilots Automatic Telephone Weather Answering Service (PATWAS) a continuous telephone recording containing current and forecast weather information for pilots.
5. Transcribed Weather Broadcast (TWEB) a continuous recording of meteorological and aeronautical information that is broadcast on L/MF and VOR facilities for pilots.
6. Limited Aviation Weather Reporting Station (LAWRS) where observers report cloud height, weather, obstructions to vision, temperature and dewpoint (in most cases). Surface wind, altimeter, and pertinent remarks.
7. Low Level Wind Shear Alert System (LLWAS) a system that detects the presence of a possible hazardous low level wind shear by continuously comparing the winds measured by sensors installed around the periphery of an airport with the wind measured at the centerfield location.
8. Pilot to Metro Service (PMSV) at selected AFB's to provide aircrews a direct contact with weather forecasters or observers.
9. Terminal Doppler Weather Radar (TDWR) is a high resolution radar used by ATC to detect all types of windshear and precipitation intensities in the airport terminal area.
10. FAA aviation weather cameras are installed throughout the state of Alaska as a supplementary weather product. An airport or facility will be noted with WX CAM when it is serviced by an aviation weather camera. See Section D for a complete list of all FAA aviation weather cameras along with their specific camera site name and location. In addition, aviation weather cameras are depicted on aeronautical charts. Also visit <http://akweathercams.faa.gov> to view images from the aviation weather cameras.

(26) COMMUNICATIONS — Clearance is required at a tower controlled airport prior to taxiing on a runway, taking off, or landing.

When operating at an airport where the control tower is operated by the U.S. Government, two-way radio communication is required unless otherwise authorized by the tower. (When the tower is operated by someone other than the U.S. Government, two-way radio communication is required if the aircraft has the necessary equipment.)

When operating at a non-tower airport but at which a Flight Service Station (FSS) is located, two-way radio communication with the FSS is desirable for the receipt of voluntary Local Airport Advisory (LAA).

A/G VOICE CALLS: Pilots should use facility or airport name as listed in this directory with designations as given in following examples when calling air/ground facilities.

ARTC Center	Anchorage "CENTER"
Flight Service Station (FSS)	Kenai "RADIO"
Control Towers	Anchorage "TOWER"
Approach Control	Anchorage "APPROACH CONTROL"
Military Airways HF	Elmendorf
Pilot to Metro on UHF	Elmendorf "METRO"
VFR Traffic Advisory Service	Anchorage "VFR ADVISORY SERVICE"
Universal A/G Station	"NAVY ADAK RADIO" CW Call "NUD"
Airlift Command Post	Elmendorf "AIRLIFT COMMAND POST"
Base Operations (PTD)	Elmendorf "OPERATIONS"

COMMUNICATION FREQUENCIES within this supplement are listed gradationally in groups following the Call Sign i.e., UHF, VHF, HF, LF/MF, with primary frequencies listed first, followed by secondary in descending order. When VHF frequencies are quoted to 3 places of decimals it indicates 25 kHz separation.

Frequencies published are those indicated by the base and/or traffic control facilities, which are required to be made known to the operational user to conduct necessary flying/ground operations. Frequencies published are transmitted and received and are monitored unless otherwise indicated by the letter "X" following the applicable frequency. This means that frequency with an "X" can be requested through the control agency under which it is listed. If there are other limitations placed upon availability of frequencies, they will be indicated space permitting, on the same line, following the frequency.

Frequencies published followed by the letter "T" or "R", indicate that the facility will only transmit or receive respectively on that frequency.

The following indicates the availability of emergency frequencies: (E) UHF 243.0 and VHF 121.5, (U) UHF 243.0 and (V) VHF 121.5

All radio aids to navigation frequencies are transmit only.

The symbol **(R)** indicates radar approach and/or departure Control.

AUTOMATIC TERMINAL INFORMATION SERVICE (ATIS): A continuous broadcast of recorded non-control information in selected terminal areas.

DIGITAL ATIS (D-ATIS): Digital ATIS provides ATIS information in text form outside the standard reception range of conventional ATIS via landline & data link communications and voice message within range of existing transmitters.

14 AIRPORT/FACILITY DIRECTORY LEGEND

GROUND COMMUNICATION OUTLET (GCO): An unstaffed, remotely controlled, ground/ground communications facility. Pilots at uncontrolled airports may contact ATC and FSS via VHF to a telephone connection to obtain an instrument clearance or close a VFR or IFR flight plan. They may also get an updated weather briefing prior to takeoff. Pilots will use four "key clicks" on the VHF radio to contact the appropriate ATC facility or six "key clicks" to contact the FSS. The GCO system is intended to be used only on the ground.

COAST GUARD: Coast Guard aircraft have the capability of transmitting and receiving on all frequencies between 118.0 MHz and 135.95 MHz.

SCHEDULED WEATHER BROADCAST: NAVAIDS providing scheduled weather broadcasts are indicated by Radio Class Code B. FAA stations broadcast at 15 past the hour, and Canadian stations broadcast at 20 and 50 minutes past the hour. Exceptions to this will be noted in the Radio/NAV/Weather Remarks. Those NAVAIDS providing continuous automatic transcribed weather broadcasts are indicated by Radio Class Code AB.

ADVISORY SERVICE for both IFR and VFR operations is available to pilots through TOWERS, Flight Service Stations (FSSs), airport UNICOMs, and AUNICOMs. The services offered by each of these facilities varies in type and extent of information furnished. Radar is used when available, to provide more exact information. Pilots should acquaint themselves with these different services and are encouraged to utilize them in the interest of safety and as an aid to air traffic control.

COMMON TRAFFIC ADVISORY FREQUENCY (CTAF) — a program designed to get all vehicles and aircraft at uncontrolled airports on a common frequency.

An airport may have a full or part-time tower or flight service station (FSS) located on the airport or a full or part-time Unicom station or no aeronautical station. There are three ways for a pilot to communicate his/her intentions or obtain airport/traffic information when operating at an airport that does not have an operating tower: by communicating with an FSS; a unicom operator; or by making a self-announce broadcast.

Frequencies which are being used currently for traffic advisory practices at airports that do not have a full time tower in operation are published and identified in the Airport/Facility Directory portion of this supplement by the letters "CTAF" located next to the frequency.

REMOTE COMMUNICATIONS OUTLET (RCO) — An unmanned air/ground communications facility, remotely controlled and providing UHF or VHF communications capability to extend the service range of an FSS.

SPECIAL USE AIRSPACE INFORMATION SERVICE (SUAIS): To assist pilots in flight planning through or around Military Operations Areas and Restricted Airspace within central Alaska, the US Air Force (USAF) maintains a SUAIS. SUAIS provides a method whereby pilots may receive "real time" information on military activity in the Fairbanks and Delta Junction areas. For further information on this service refer to Section D, Associated Data.

RESUMPTION OF MANNED SERVICE AT PART-TIME FLIGHT SERVICE STATIONS: At part-time FSS's every attempt will be made to provide manned service during emergencies. Request for resumption of manned operation during an emergency may be made by contacting any ATC facility in Alaska.

LIFEGUARD FLIGHTS: Civil ambulance flights carrying ill or injured persons are expedited and appropriate notifications are made upon pilot request. Pilots of such aircraft are invited to utilize this service for those missions of an urgent medical nature and to maintain the integrity of the program by using discretion in its application. To use the service add the word "Lifeguard" to remarks in your flight plan and prefix your aircraft identification with the word "Lifeguard" in radio callups. Example: "Anchorage Radio Lifeguard Cessna 263K."

(27) AIRSPACE— Information concerning Class B, C, and part-time D and E surface area airspace shall be published with effective times.

Class D and E surface area airspace that is continuous as established by Rulemaking Docket will not be shown.

CLASS B—Radar Sequencing and Separation Service for all aircraft in CLASS B airspace.

CLASS C—Separation between IFR and VFR aircraft and sequencing of VFR arrivals to the primary airport.

TRSA—Radar Sequencing and Separation Service for participating VFR Aircraft within a Terminal Radar Service Area.

Class C, D, and E airspace described in this publication is that airspace usually consisting of a 5 NM radius core surface area that begins at the surface and extends upward to an altitude above the airport elevation (charted in MSL for Class C and Class D). Class E surface airspace normally extends from the surface up to but not including the overlying controlled airspace. When part-time Class C or Class D airspace defaults to Class E, the core surface area becomes Class E. This will be formatted as:

AIRSPACE: CLASS C svc "times" ctc **APP CON** other times CLASS E:

or

AIRSPACE: CLASS D svc "times" other times CLASS E.

When a part-time Class C, Class D or Class E surface area defaults to Class G, the core surface area becomes Class G up to, but not including, the overlying controlled airspace. Normally, the overlying controlled airspace is Class E airspace beginning at either 700' or 1200' AGL. This will be formatted as:

AIRSPACE: CLASS C svc "times" ctc **APP CON** other times CLASS G, with Class E 700' (or 1200') AGL & abv:

or

AIRSPACE: CLASS D svc "times" other times CLASS G with CLASS E 700' (or 1200') AGL & abv:

or

AIRSPACE: CLASS E svc "times" other times CLASS G with CLASS E 700' (or 1200') AGL & abv.

NOTE: AIRSPACE SVC "TIMES" INCLUDE ALL ASSOCIATED ARRIVAL EXTENSIONS. Surface area arrival extensions for instrument approach procedures become part of the primary core surface area. These extensions may be either Class D or Class E airspace and are effective concurrent with the times of the primary core surface area. For example, when a part-time Class C, Class D or Class E surface area defaults to Class G, the associated arrival extensions will default to Class G at the same time. When a part-time Class C or Class D surface area defaults to Class E, the arrival extensions will remain in effect as Class E airspace.

NOTE: CLASS E AIRSPACE EXTENDING UPWARD FROM 700 FEET OR MORE ABOVE THE SURFACE, DESIGNATED IN CONJUNCTION WITH AN AIRPORT WITH AN APPROVED INSTRUMENT PROCEDURE.

Class E 700' AGL (shown as magenta vignette on sectional charts) and 1200' AGL (blue vignette) areas are designated when necessary to provide controlled airspace for transitioning to/from the terminal and enroute environments. Unless otherwise specified, these 700'/1200' AGL Class E airspace areas remain in effect continuously, regardless of airport operating hours or surface area status. These transition areas should not be confused with surface areas or arrival extensions.

(See Chapter 3, AIRSPACE, in the Aeronautical Information Manual for further details)

(28) RADIO AIDS TO NAVIGATION — Consists of radio aids to navigation which have the same name as the radio facility and/or airport, and different name radio aids to navigation which are located on the airport or are used to furnish final approach guidance on a published government instrument approach procedure serving the airport. NAVAIDS 'At Fld' are located 1 NM or less from the Airport Landing Surface. When Bearing and Distance to Fld is used, it represents the magnetic bearing and nautical mile distance from the NAVAID to geographical coordinates (Airport Reference Point). Magnetic bearing and distance are shown from the facility to the airport, e.g. 006° 6.4 NM to fld. Elevation and variation are shown for the facility, e.g. 280/21E. Where VOR Test Facilities (VOT) are located, the designated VOT and frequency will follow the title.

RADIO CLASS DESIGNATIONS

VOR/DME/TACAN Standard Service Volume (SSV) Classifications

SSV Class	Altitudes	Distance (NM)
(T) Terminal	1,000' to 12,000'	25
(L) Low Altitude	1,000' to 18,000'	40
(H) High Altitude	1,000' to 14,500'	40
	14,500' to 18,000'	100
	18,000' to 45,000'	130
	45,000' to 60,000'	100

NOTE: Additionally, (H) facilities provide (L) and (T) service volume and (L) facilities provide (T) service. Altitudes are with respect to the station's site elevation. Coverage is not available in a cone of airspace directly above the facility.

The term VOR is, operationally, a general term covering the VHF omnidirectional bearing type of facility without regard to the fact that the power, the frequency protected service volume, the equipment configuration, and operational requirements may vary between facilities at different locations.

AB _____	Automatic Weather Broadcast
B _____	Scheduled Weather Broadcast
DF _____	Direction Finding Service.
DME _____	UHF standard (TACAN compatible) distance measuring equipment.
H _____	Non-directional radio beacon (homing), power 50 watts to less than 2,000 watts (50 NM at all altitudes).
HH _____	Non-directional radio beacon (homing), power 2,000 watts or more (75 NM at all altitudes).
H-SAB _____	Non-directional radio beacons providing automatic transcribed weather service.
ILS _____	Instrument Landing System (voice, where available, on localizer channel).
LDA _____	Localizer Directional Aid.
LMM _____	Compass locator station when installed at middle marker site (15 NM at all altitudes).
LOM _____	Compass locator station when installed at outer marker site (15 NM at all altitudes).
MH _____	Non-directional radio beacon (homing) power less than 50 watts (25 NM at all altitudes).
MLS _____	Microwave Landing System.
S _____	Simultaneous range homing signal and/or voice.
SABH _____	Non-directional radio beacon not authorized for IFR or ATC. Provides automatic weather broadcasts.
SDF _____	Simplified Direction Facility.
TACAN _____	UHF navigational facility-omnidirectional course and distance information.
VOR _____	VHF navigational facility-omnidirectional course only.
VOR/DME _____	Collocated VOR navigational facility and UHF standard distance measuring equipment.
VORTAC _____	Collocated VOR and TACAN navigational facilities.
W _____	Without voice on radio facility frequency.
Z _____	VHF station location marker at a LF radio facility.

ILS FACILITY PERFORMANCE CLASSIFICATION CODES

Codes define the ability of an ILS to support autoland operations. The two portions of the code represent Official Category and farthest point along a Category I, II, or III approach that the Localizer meets Category III structure tolerances.

Official Category: I, II, or III; the lowest minima on published or unpublished procedures supported by the ILS.

Farthest point of satisfactory Category III Localizer performance for Category I, II, or III approaches: A – 4 NM prior to runway threshold, B – 3500 ft prior to runway threshold, C – glide angle dependent but generally 750–1000 ft prior to the threshold, T – runway threshold, D – 3000 ft after runway threshold, and E – 2000 ft prior to stop end of runway.

16 AIRPORT/FACILITY DIRECTORY LEGEND

ILS information is tabulated as indicated in the following sample:

ILS/DME 109.9 I-MWM Chan 36 Rwy 18. Class IIE.

ILS Facility Performance
Classification Code

NAVIGATIONAL AID DISTURBANCES: Radio beacons are subject to disturbances that may result in loss of signal or erroneous bearing information. Such disturbances result from intermittent/unpredictable signal propagation due to such factors as precipitation static night effect/interfering skywave, mountain effect, and costal refraction; e.g., ice crystals or other types of precipitation static may reduce the coverage of an NDB. Any one of these factors or a combination may derogate the arriving NDB signal to the point of being unusable as a primary NAVAID. Nearly all disturbances which affect the ADF bearing also affect the facility's identification: noisy identification usually occurs when the ADF needle is erratic; voice, music, or erroneous identification will usually be heard when a steady false bearing is being displayed. Since ADF receivers do not have a "FLAG" to warn the pilot when erroneous bearing information is being displayed, the pilot should continuously monitor the NDB's identification. On some VOR's, minor course needle fluctuations and brief flag alarm signals may be observed. (Some receivers are more subject to these irregularities than others.) Certain propeller RPM settings can cause VOR course deviation fluctuations as much as 6 degrees. Slight changes to the RPM setting will normally smooth out this roughness. Helicopter rotor speeds may also cause VOR disturbances. Check for these phenomena prior to reporting VOR malfunction. Pilots flying over unfamiliar routes are cautioned in particular to use the "To - From" indicator to determine positive station passage.

(29) RADIO/NAV/WEATHER REMARKS — Pertinent remarks affecting the current status or usability of radio communication, radio aid to navigation and availability of weather data.

(30) AIR TRAFFIC CONTROL CENTER — with associated frequencies.

(31) LOW ALTITUDE FREQUENCIES — are shown in light type.

(32) HIGH ALTITUDE FREQUENCIES — are shown in bold type.

(33) SERVICES — Services provided and frequency use directionally.

(34) REMOTE TRANSMITTER SITES — Remote communications air-ground facility (RCAG) outlets with associated frequencies.

FREQUENCY PAIRING PLAN AND MLS CHANNELING

MLS CHANNEL	VHF FREQUENCY	TACAN CHANNEL	MLS CHANNEL	VHF FREQUENCY	TACAN CHANNEL	MLS CHANNEL	VHF FREQUENCY	TACAN CHANNEL
500	108.10	18X	568	109.45	31Y	636	114.15	88Y
502	108.30	20X	570	109.55	32Y	638	114.25	89Y
504	108.50	22X	572	109.65	33Y	640	114.35	90Y

ABBREVIATIONS

The following state and province abbreviations are in use in this Supplement.

AK	— Alaska	ID	— Idaho	PN	— Panama
ALTA	— Alberta	IL	— Illinois	PO	— Azores
BC	— British Columbia	JA	— Japan	RP	— Philippines
CA	— California	MD	— Maryland	SASK	— Saskatchewan
EN	— England	ME	— Maine	SH	— Ascension Is
FL	— Florida	MT	— Montana	TU	— Turkey
GU	— Guam	NWT	— Northwest Territory	WA	— Washington
HI	— Hawaii	OR	— Oregon	YT	— Yukon Territory

The following abbreviations are those commonly used within this Supplement. Additional abbreviations will be found in the Flight Information Handbook (FIH).

AAF	— Army Air Field	Emerg	— emergency	MM	— Middle Marker
ACC	— Air Combat Command	fac	— facility	MSL	— Mean Sea Level
acft	— aircraft	facilities	— facilities	MWARA	— Major World Air Route Area
ACWS	— Aircraft Control and Warning Squadron	fld	— field	NDB	— Non-Directional Radio Beacon
adj	— adjacent	FM	— Frequency Modulation or Fan Marker	NM	— nautical miles
AFB	— Air Force Base	freq	— frequency	NVG	— Night Vision Goggle
AFS	— Air Force Station	FSS	— Flight Service Station	ODALS	— Omni Directional Approach Lighting System
AGL	— Above Ground Level	F/W	— Fixed Wing	OLS	— Optical Landing System
A/G	— Air/Ground	GND CON	— Ground Control	Opr(s)	— Operates
AHP	— Army Helipoint	GS	— Glide Slope	OPS	— Flight Operations (coordinated)
AID	— Airport Information Desk	GWt	— gross weight	O/R	— On Request
alt	— altitude	hr	— hour(s)	O/S	— Out of Service
AM	— Amplitude Modulation	HW	— Heavy Weight	OT	— Other Times
AMC	— Air Mobility Command	Hz	— Hertz (cycles per second)	PAPI	— Precision Approach Path Indicator
ADE	— Airport of entry	IFF	— Identification Friend or Foe	PAEW	— personnel and equipment working
APP CON	— Approach Control	IFSS	— International Flight Service Station	PATWAS	— Pilot's Automatic Telephone Weather Answering Service
ARFF	— Aircraft Rescue and Fire Fighting	intl	— international	PCL	— Pilot controlled lighting
arpt	— airport	invoF	— in the vicinity of	PMSV	— Pilot to Metro Service
arr	— arrive, arrival	JOSAC	— Joint Operational Support Airlift Center	PPR	— Prior Permission Required
ARS	— Air Reserve Station	kHz	— kilohertz	prim	— primary
ARTCC	— Air Route Traffic Control Center	Kt or K	— Knots	PTD	— Pilot to dispatcher
ATIS	— Automatic Terminal Information Service	LAA	— Local Airport Advisory	PVASI	— Pulsating Visual Approach Slope Indicator
avbl	— available	LAWRS	— Limited Aviation Weather Reporting Station	rad	— radial
AWOS	— Automated Weather Observing System	lbs	— pounds	RAIL	— Runway alignment indicator lights
bcast	— broadcast	LC	— Local Call	RCAG	— Remote Communications Air/Ground Facility
brg	— bearing	lczr	— localizer	RCO	— Remote Communications Outlet
Chan	— channel	LD	— Long Distance	RCR	— Runway Condition Reading
cinc	— clearance	LDA	— Localizer Type Directional Aid	rgt	— right
CO	— Commanding Officer	LDIN	— Lead in lights	rng	— range
const	— construction	LDOCF	— Long Distance OPS Control Facility	RPI	— Runway point of interception
CTAF	— Common Traffic Advisory Frequency	lgts	— lights	RRP	— Runway Reference Point
Ctc	— Contact	LLWAS	— Low Level Wind Shear Alert System	RSRS	— reduced same runway separation
decom	— decommission, decommissioned	LRA	— Landing Rights Airport	R/W	— Rotary Wing
DEP CON	— Departure Control	LRRS	— Long Range RADAR Station	rwY	— runway
DL	— Direct Line	mag	— magnetic	SAWRS	— Supplementary Aviation Weather Reporting Station
EFAS	— En Route Flight Advisory Service	maint	— maintenance		
Elev	— elevation	MALS	— Medium Intensity Approach Lights		
ELT	— Emergency Locator Transmitter	MHz	— megahertz		
		MJI	— Meaconing, Intrusion, Jamming and Interference		
		mil	— military		
		min	— minutes		

secd	— secondary	TAC	— Tactical Air Command	UFN	— Until Further Notice
SFA	— Single Freq approach	Tac Ftr Sq	— Tactical Fighter Squadron	var	— Magnetic variation
SIF	— Selective Identification Feature	TCH	— Threshold Crossing Height	VASI	— Visual Approach Slope Indicator
SPB	— Seaplane Base	tfc	— traffic	vis	— visibility, visible
SR	— Sunrise	thld	— threshold	VOT	— VOR test facility
SS	— Sunset	TPA	— Traffic Pattern Altitude	WG	— Wing
SSB	— Single Side Band	TWEB	— Transcribed Weather Broadcast	WSFO	— Weather Service Forecast Office
stn	— station	twr	— tower	WSO	— Weather Service Office
svc	— service	UC	— Under Construction	wx	— weather
svcg	— servicing

DIAP

Attended Mon-Fri 1700-0200Z†. All military, government and civil aircraft operators shall obtain a PPR control number a minimum of 1 hour prior to departure for site, request no earlier than day of planned travel, etc site personnel at: DSN 317-552-2372/2869, C907-552-2372/2869. Aircraft is CLOSED weekends and all federal holidays. Passengers must coordinate all travel with ARS Program Management (DSN 317-552-4400/1989 or C907-552-4400/1989) on all non-emergency travel to site. USAF installation, all civil aircraft operators require civil aircraft landing permits prior to landing at facility. Fines will be levied against violators and reports will be forwarded to FAA FSDOS IAW 32CFR855 and USAF Operating Instructions. Operators must have on board a copy of current permit. For permits call 907-552-7384/3636/5265. CAUTION: Runway located on side of 2100' mountain. Runway 02 slope 2.3% up NE. Approach from SW, land Runway 02 only. Takeoff Runway 20 only. High terrain both sides and N end of runway. Successful go-around improbable. CAUTION: Winds in excess of 20 knots may produce severe turbulence. Due to terrain, winds from 070° to 150° may be stronger than reported winds. Daylight operations only. BE ALERT: Possibly large numbers of 'Glaucous Gulls' may be present in the area of Cape Romanzof LRRS airfield during early to mid June. Also Canada geese and tundra swans during mid August to early September. The increased bird and gull activity is in addition to the bird activities in the Risk Analysis of Wildlife Hazards to aircraft at Cape Romanzof. Diligence by all personnel is recommended throughout the season. During local commercial and subsistence herring fishery activities, gulls have been observed in high numbers (500-1,000) on the beach between the approach to the runway. BE ALERT: Sharp dropoff west side of runway. Restricted 180° turns to north end of runway at apron area. CAUTION: Non-standard airfield markings. Establish radio contact as soon as possible prior to landing. CAUTION: Windsock located at the NW end of runway at runway edge 18' high. Use caution when taxiing. After initial contact on 126.2 or 121.5 expect a 30 minute delay for current airstrip conditions. ① Runway 02, GS 2.5°. ② Runway 02.

AIRPORT REMARKS —PPR rqr for all acft except non-explosive laden AMC channel missions, and AIREVAC. PPR NRS will be provided b/n 24 hrs and 5 days prior to arr, ctc base ops DSN 317-552-2107/1202 or C907-552-2107/1202. Non-AMC acft ctc base ops prior to dep from previous station and 30 minutes prior to arr for parking and servicing. PPR valid 6 hrs prior to or after ETA. Alaska Regional Flight Center (AKRFC) opr 1630-0130Z weekdays. Ask AMOPS for parking location when requesting a PPR. Ctc Ram South 10 minutes prior to ldg on 124.65. Early and late arrivals must be re-coordinated through AMOPS. Units deploying more than two aircraft intending to fly any sorties that originate and terminate at Elmendorf must ctc 3 WG scheduling DSN 317-552-2406 no later than 90 days prior to arrival to obtain sponsoring unit information. Units deploying with two or less aircraft will ctc 3 WG scheduling ASAP but no later than 30 days prior to arrival. All VIP acft ctc Base Ops 30 min prior to arr. Acft rqr customs ctc Base Ops 90 min prior to arr via global radio. Flights orig outside the state, refer to Alaska section of USAF-Foreign Clearance Guide. Heavily congested airspace, see FAR 93 or Alaska Supplement for alt rstd on final approach to RWY 06. Hvy migratory bird act during Apr-May/Aug-Oct periods may pose a significant haz to acft. Rpt all bird or animal strikes on, or in vicinity of, Elmendorf to PTD or 3WG/SE DSN 317-552-4128/3389. Ngt vision goggle ops on Rwy 16-34 and Rwy 06-24 Mon-Fri from 0400-1000Z. CAUTION-R2203 freq active; when unable to avoid, ctc control twr. All trans aircrews opr out of Elmendorf intending on local missions (Cope Thunder, USARK, Exercises, Guard Airlift, Off-station trng, etc) must receive a local briefing from 3 OG/CC at 317-552-2262. All tran aircrews on local missions are required to deploy with crew chiefs due to limited trans maintenance support. Note: Due to the lack of transient alert support for all F-15C/F-15E's, units flying F-15C/F-15E's landing at Elmendorf need to coordinate with wing scheduling no later than 30 days prior to arrival to ensure the appropriate support is available. Transient Maintenance: Aircraft Services are limited to POL servicing, intake/exhaust inspections, F-16 chip detector inspections and EOR inspections. Transient acft requiring

AIRPORT REMARKS —Attended Mon-Fri 1700-0200Z. Be Alert: Seaplane ops in summer and skiplane ops in winter from Alexander Lake not depicted on charts and located approximately one mile NE of Galena/Pitka Rwy 07-25. App/Dep from Alexander Lake crosses extended centerline of Rwy 07-25 one mile NE of Galena Pitken arpt. Numerous obstructions in vicinity of Rwy 07-25 not identified on terminal approach plates. Ultralights on and in/ov arpt. Dike both ends of Rwy 07-25. CAUTION: Possible wind shear blw 2000' AGL on final apch Rwy 07-25. CAUTION: Snow removal ops on Rwy 07-25, monitor CTAF. Uncontrolled vehicles may cross dike on final approach to Rwy 07. CAUTION: During approaches to Rwy 07, there may be a visual illusion caused by rising terrain leading to the airport and the dike. This visual illusion may make the pilot feel higher than the aircraft actually is. This optical illusion may be worse at night, due to no lead-in approach lighting to Rwy 07. Using REIL may help identify the Rwy 07 displaced threshold. CAUTION: During winter approaches to Rwy 25, proper height perception may be difficult, due to a lack of contrast caused by snow and the frozen Yukon River. Rwy 25 VASI RPI is 814' from threshold. First useable 975' of Rwy 25 is concrete and may differ in appearance and braking action from remaining portion of rwy. 24 hr credit card system for purchase 100LL & Jet A. Pay phone available. DIAP**AIRPORT REMARKS**—CLOSED to the public. OFFICIAL BUSINESS ONLY.

Attended Mon-Fri 1700-0200Z†, CLOSED weekends and holidays. Allmilitary, government and civ acft opr shall obtain a PPR cti number a min of 1 hr prior to dep for site, req no earlier than day of planned travel, ctc site personnel at: DSN 317-552-9403/9283, C907-552-9403/9283. Passengers must coordinate all travel with ARS Program Mgmt (DSN 317-552-4400/1989 or C907-552-4400/1989) on all non-emergency travel to site. USAF installation, all civil acft operators require civil acft landing permits prior to landing at facility. Fines will be levied against violators and reports will be forwarded to FAA FSDOS IAW 32CFR855 and USAF Operating Instructions. Operators must have on board a copy of current permit. For permits call 907-552-7384/3636/5265. Turbulence on approach. Radome winds not always avbl. Daylight operations only. CAUTION: Winds in excess of 20 kts may produce severe turbulence. BE ALERT: Increased threat to acft by the possible presence of large numbers of 'Sandhill Cranes' in the area of the arpt during mid May. These cranes are quite large (3' long with 6½ windspan) and slow flying. They fly and graze in large flocks. The increased risk is in addition to the bird activities in the Risk Analysis of Wildlife Hazards to acft at Tin City arpt. Diligence by all personnel is recommended throughout the season. Field on high bluff. Rwy center higher than both ends no line of sight. Establish radio contact as soon as possible prior to landing. After initial contact on 126.2 or 121.5 expect a 30 min delay for current airstrip conditions. ①Rwy 16 and 34. ②Rwy 16 and 34.

AERONAUTICAL CHART BULLETIN

The purpose of this bulletin is to provide major changes in aeronautical information that have occurred since the last publication date of each Sectional Aeronautical, VFR Terminal Area, and Helicopter Route Charts listed. The general policy is to include only those changes to controlled airspace and special use airspace that present a hazardous condition or impose a restriction on the pilot, and major changes to airports and radio navigational facilities, thereby providing the VFR pilot with the essential data necessary to update and maintain chart currency. The data is grouped by type and then by effective date. When a new edition of the Aeronautical Chart is published, the corrective tabulation will be removed from this bulletin. Inasmuch as this Bulletin provides major changes only, pilots should consult the airport listing in this directory for all new information. Users of U.S. World Aeronautical Charts (WAC) and U.S. Gulf Coast VFR Aeronautical Charts should consult the appropriate Sectional and VFR Terminal Area Charts for revisions.

Military Training Routes (MTRs) are shown on Sectional Aeronautical Charts, VFR Terminal Area, and Helicopter Route Charts. Only the route centerline, direction of flight and the route designator are shown — route widths and altitudes are not shown. Since these routes are subject to change every 56 days and the charts are reissued generally every 6 months, routes with a change in the alignment of the charted route centerline will be listed in this Aeronautical Chart Bulletin below. You are advised to contact the nearest FSS for route dimensions and current status for those routes affecting your flight.

7 May 2009 Revise KING SALMON Class D: That airspace extending upward from the surface to and including 2,500 feet MSL within a 4.4-mile radius of the King Salmon Airport, AK. This Class D airspace area is effective during the specific dates and times established in advance by a Notice to Airmen. The effective date and time will thereafter be continuously published in the Airport/Facility Directory.

Revise KING SALMON Class E2: Within a 4.4-mile radius of the King Salmon Airport, AK. This Class E airspace area is effective during the specific dates and times established in advance by a Notice to Airmen. The effective date and time will thereafter be continuously published in the Airport/Facility Directory.

Revise KING SALMON Class E4: That airspace extending upward from the surface within 4 miles either side of the 312° bearing from the King Salmon Airport, AK, to 10.7 miles northwest of the King Salmon Airport, AK.

Revise KING SALMON Class E5: That airspace extending upward from 700 feet above the surface within a 6.9-mile radius of the King Salmon Airport, AK, and within 5 miles north and 9 miles south of the 132° radial of the King Salmon VORTAC, AK, extending from the King Salmon VORTAC, AK, to 36 miles southeast of the King Salmon VORTAC, AK, and within 3.9 miles either side of the 312° radial of the King Salmon VORTAC, AK, extending from the 6.9-mile radius to 13.9 miles northwest of the King Salmon VORTAC, AK; and that airspace extending upward from 1,200 feet above the surface within a 73-mile radius of the King Salmon Airport, AK.

22 Jul 2009 No Major Changes.

27 Aug 2009 Revise airway T 219 from DILLINGHAM VOR/DME (DLG) to BROUS FIX (59°08'31"N, 159°18'24"W) to NACIP FIX (59°23'18"N, 160°38'06"W) to ACATE WP (59°42'51"N, 162°33'10"W) to RUFVY WP (59°56'34"N, 164°02'04"W) to NANWAK NDB/DME (AIX).

Revise airway T 223 from CEKBA FIX (58°56'15"N, 159°13'32"W) to DILLINGHAM VOR/DME (DLG) to ZUNOS FIX (59°26'42"N, 157°02'46"W) to FAGIN FIX (59°51'56"N, 155°32'43"W).

Revise airway T 227 from JANNT WP (52°04'18"N, 178°15'37"W) to BAERE WP (52°12'12"N, 176°08'09"W) to ALEUT FIX (54°14'17"N, 166°32'52"W) to MORDI FIX (54°52'50"N, 165°03'15"W) to GENFU FIX (55°23'18"N, 163°06'21"W) to BINAL WP (55°46'00"N, 161°59'56"W) to PORT HEIDEN NDB/DME (PDN) to AMOTT FIX (60°53'56"N, 151°21'46"W) to ANCHORAGE VOR/DME (ANC) to FAIRBANKS VORTAC (FAI) to DEADHORSE VOR/DME (SCC).

Revise airway T 228 from CAPE NEWENHAM NDB/DME (EHM) to KUCYE WP (58°51'16"N, 162°21'57"W) to RUFVY WP (59°56'34"N, 164°02'04"W) to DENRO FIX (61°14'19"N, 165°44'51"W) to HOOPER BAY VOR/DME (HPB) to ITKIC FIX (61°50'38"N, 166°02'43"W) to JTSKI FIX (61°56'06"N, 166°01'13"W) to HALEM FIX (62°10'25"N, 165°57'15"W) to NOME VOR/DME, (OME) to HIKAX WP (65°36'20"N, 165°44'44"W) to SHISHMAREF NDB (SHH) to ECIPI FIX (67°55'48"N, 165°29'58"W) to BARROW VOR/DME (BRW) to DEADHORSE VOR/DME (SCC) to ROCES WP (70°08'34"N, 144°08'16"W).

22 Oct 2009 Add QUINHAGAK, AK. Class E. That airspace extending upward from 700 feet above the surface within a 6.4-mile radius of the Quinhagak Airport, AK.

SPECIAL NOTICES

NOTICES TO AIRMEN

Special Notices of a **permanent** nature will be carried for two issues and then incorporated in the appropriate section of this publication, other applicable FLIP product or the Aeronautical Information Manual (AIM) Basic Flight Information and ATC Procedures, however, operational requirement may necessitate certain notices being carried for a longer period. Notices of a **temporary** nature will be carried in this section for the life of the notice. **New** or **modified** notices are emphasized by an outline and the date of first issuance at the top of the notice. Outline will be eliminated from temporary notices after two issues and issuance data will be relocated at the end of the notice.

A Special Notice section concerning NEW FLIP FEATURES appears below and contains notices of new requirements or major modifications of existing FLIPS. New notices appearing for the first time shall be shown first. New feature notices will be carried for two issues and then dropped. In the event there are no new FLIP features, the word "NONE" shall be centered within the new FLIP feature box.

Special Notices within this supplement are identified as Military/Civil, Military, and Civil, MILITARY PILOTS SHOULD CONSULT DOD FLIGHT INFORMATION PUBLICATION AP I AREA PLANNING, NORTH AND SOUTH AMERICA.

NEW FLIP FEATURES
NONE

CONTINUOUS POWER FACILITIES

In order to insure that a basic ATC system remains in operation despite an areawide or catastrophic commercial power failure, key equipment and certain airports have been designated to provide a network of facilities whose operational capability can be utilized independent of any commercial power supply.

In addition to those facilities comprising the basic ATC system, the following approach and lighting aids have been included in this program for a selected runway.

1. ILS (Localizer, Glide Slope, COMLO, Inner, Middle and Outer Markers)
2. Wind Measuring Capability
3. Approach Light System (ALS) or Short ALS (SALS)
4. Ceiling Measuring Capability
5. Touchdown Zone Lighting (TDZL)
6. Centerline Lighting (CL)
7. Runway Visual Range (RVR)
8. High Intensity Runway Lighting (HIRL)
9. Taxiway Lighting
10. Apron Light (Perimeter Only)

The following have been designated "Continuous Power Airports," and have independent back up capability for the equipment installed.

Airport/Ident	Runway No.	Airport/Ident	Runway No.
Albuquerque, NM (ABQ)	08	Milwaukee, WI (MKE)	01L

NOTE—The existing CPA runway is listed. Pending and future changes at some locations will require a revised runway designation.

(28 Jun 1990)

INTERTIE POWER LINE

Civil/Military

Caution advised between Kashwitna River 61° 50'N/150° 02'W and Cantwell 63° 22'N/148° 50'W along the Intertie Power Line. They are not marked with the international orange marker balls.

NOTAM

Civil/Military

PROVISION OF HF AERONAUTICAL MOBILE SERVICE TO AIRCRAFT OPERATING WITHIN THE ANCHORAGE ARCTIC CTA/FIR REFERENCE HIGH FREQUENCY AERONAUTICAL MOBILE SERVICE COMMUNICATIONS SUPPORT TO AIRCRAFT OPERATING IN THE ANCHORAGE ARCTIC CTA/FIR. THIS NOTAM IS TO CLARIFY ENROUTE COM PROCEDURES AND DOCUMENT THOSE NOW GENERALLY EMPLOYED IN SUPPORT OF FLIGHT OPERATIONS IN THE ANCHORAGE ARCTIC CTA/FIR BEYOND LINE OF SIGHT RANGE OF REMOTE CONTROL VHF AIR/GROUND FACILITIES OPERATED FROM THE ANCHORAGE ARTCC. FLIGHT CREWS OPERATING AIRCRAFT IN THAT AIRSPACE UNDER THOSE CIRCUMSTANCES ARE EXPECTED TO MAINTAIN COMMUNICATIONS WITH GANDER RADIO AND A LISTENING OR SELCAL WATCH ON HF FREQUENCIES OF NORTH ATLANTIC DELTA NAT D NETWORK, VIZ. 2971, 4675, 8891, 11279 KHZ. GANDER RADIO WILL ACCOMPLISH NECESSARY RELAY BETWEEN ENROUTE AIRCRAFT AND THE ANCHORAGE CENTER. ADDITIONALLY AND IN VIEW OF REPORTED MARGINAL RECEPTION OF HONOLULU PACIFIC VOLMET BROADCAST IN THAT AND ADJACENT CANADIAN AIRSPACE, GANDER RADIO CAN PROVIDE ANCHORAGE AND FAIRBANKS SURFACE OBSERVATIONS AND TERMINAL FORECASTS TO FLIGHT CREWS ON REQUEST.

CONTRACT WEATHER REPORTING STATIONS

Civil/Military

Various contract weather reporting stations provide only periodic hourly weather and no special observations (NOSPL). Consult the Airport/Facility Directory or NOTAMS for stations not meeting FAR 121/135 requirements. (1 Aug 85)

TERRACE, BC, CANADA

Civil/Military

CAUTION: Kitimat area —Hydrogen burn-off area 54°02' N 128°41'W for a 2 NM radius. Flame is invisible, avoid flight below 1000' AGL. (28 Oct 1982)

POLLUTION REPORT (POLREP) FORMAT

Civil/Military

1. Pilots are requested to volunteer reports of water pollutants (oil, chemicals, dye etc.) including size, source of pollutant, on-scene weather and other significant information. The POLREP should be transmitted to the U.S. Coast Guard National Response Center (NRC), telephone 800-424-8802, via communications with either the parent command, USAF Global Command Control System Station or any U.S. Coast Guard Air Station.
 2. Pollution reports should be made any time pollution is sighted within 50 nautical miles of the U.S. shoreline, on the Great Lakes, or on the navigable rivers of the United States.
 3. POLREP FORMAT:
 - a. Pollution substance (oil, dye, etc.)
 - b. Location (latitude-longitude or radial/DME)
 - c. Size of slick/polluted area (meters, yards, miles)
 - d. Time discovered (UTC)
 - e. Direction of movement
 - f. Source (course, speed, name, if vessel)
 - g. Condition of pollutant (breaking up, heavy dark streaks, pancake shape, etc.)
 - h. On-scene weather (wind speed, wind direction, sea state, visibility, percent cloud cover)
 - i. Identification and parent command of reporting source.
- (23 Mar 1978)
-

PORT VALDEZ AREA

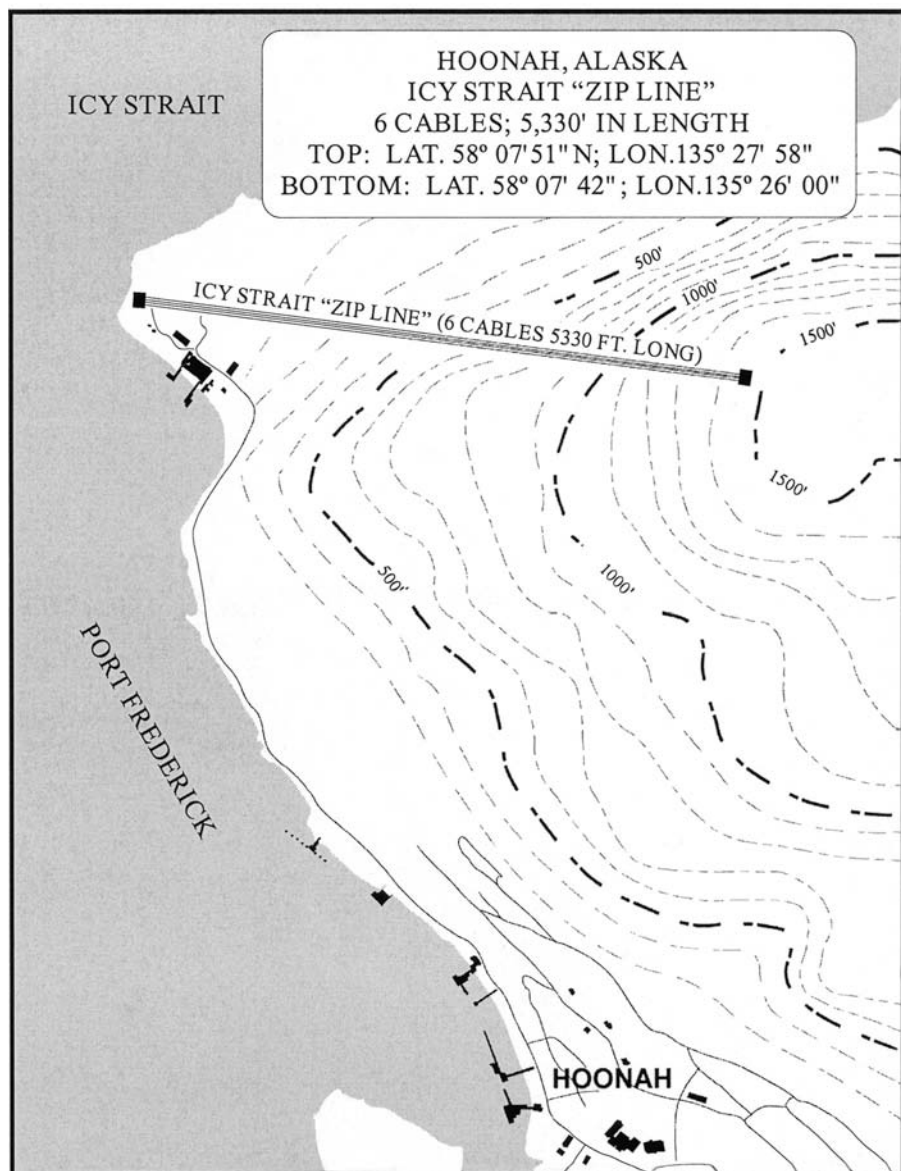

Civil/Military

Aircraft operating outside of controlled airspace below 600 feet mean sea level in the Valdez Arm, Valdez Narrows and Port Valdez are advised to avoid flight over or near tankers in compliance with FAR 91.119C. Juneau is the coordinating Flight Service Station. (6 Oct 1977)

AVIATION FUEL

Civil

Responsibility for assuring availability of aviation fuel at enroute stops rests solely with the pilot. Confirmation of availability of fuel should be made directly with fuel dispensers at locations where refueling is planned. (11 Aug 1977)

GENERAL NOTICES

REPORTABLE AVIATION ACCIDENTS OR INCIDENTS

The National Transportation Safety Board (NTSB) is the federal agency charged with investigating all civil and most government aviation accidents. If you are involved in an aviation accident, or reportable incident, you may fulfill your immediate reporting obligation by calling the NTSB field office in Anchorage. This office is responsible for investigating all aviation accidents that occur in Alaska. Their daytime telephone number is: (907) 271-5001. After normal duty hours, please call (907) 271-5936, and ask to speak with an NTSB investigator. Should questions arise regarding what constitutes an accident or incident, or if you have any other questions about the NTSB, please call the NTSB.

ENTRY REQUIREMENTS (CIVIL)

Air Commerce Regulations of the United States place certain responsibilities upon owners and operators of aircraft engaging in flights to and from foreign countries.

Customs, and other agencies concerned, desire to facilitate air travel to the fullest extent possible while carrying out their responsibilities. Plane operators can assist greatly by familiarizing themselves with the regulations and by complying with them under all circumstances. Failure to do so may incur substantial penalties.

The following sets forth the principal requirements of concern to private plane operators engaging in international flights. In general, a private aircraft is considered to be an aircraft owned, leased or rented by the operator or his employer and not carrying passengers or cargo for hire nor proceeding to, or returning from, a place from which or to which passengers or cargo have been or will be carried for hire. Such an aircraft may carry the owner's or operator's guests or employees. Private aircraft will not be required to file entry or departure documents.

FLIGHTS ACROSS U.S. BORDERS. — All pilots contemplating flights across U.S. borders should refer to complete regulations in latest INTERNATIONAL FLIGHT INFORMATION MANUAL. Pilots must report for inspection at the time of each entry to avoid inconveniences, additional expenses and penalties.

OVERTIME CHARGES, OTHER EXPENSES. — The operator of private aircraft will be required to pay overtime charges for inspections performed by Customs and Immigration Officers during hours other than regular office hours and on Sundays and Holidays. The operator will be required to pay transportation and all expenses, up to \$25.00, incurred in connection with the inspection of aircraft at airports not manned by customs officers. The U.S. Customs Service suggests that pilots contact the customs officer direct prior to departure to obtain latest information on customs hours and estimated overtime charges, if any, since such costs sometimes are substantial.

292 NOTICES

INTERNATIONAL AIRPORTS OF ENTRY. — If the operator of a private aircraft returning to, or visiting, the United States wishes to land at an International Airport of Entry, two hours advance notice is required, but more is desired. If arrival will be after normal business hours, notice during business hours is advisable. If this is not practical, please give as much more than the required two hours as is possible. You may expedite your customs inspection by providing timely notice. The following are International Airports of Entry in Alaska.

Airport	Telephone
Juneau/Juneau Intl	907-586-7211
Wrangell/Wrangell	907-874-3415
*Wrangell/Wrangell SPB	907-874-3415

*Flight Service notification to U.S. Customs not available.

OTHER AIRPORTS. — If the operator intends to land at a place not designated as International Airport of Entry, he must obtain permission to make such landing and give advance notice of arrival to the customs office nearest the intended place of first landing. Advance notice of arrival may be included in your Flight Plan filed in Canada if destined to an airport where flight notification service is available and this notice will be treated as an application for permission to land.

The following airports in Alaska are manned by customs officers and permission to land at these airports may be obtained from the customs officers at the airport. Requests for permission should be submitted during regular office hours. If such requests are not submitted during office hours, additional advance notice (two hours or more) should be given to help prevent delay in locating an officer.

Airport	Telephone	Airport	Telephone
³ Anchorage/Ted Stevens Anchorage Intl	907-271-6313	² Northway/Northway	907-778-2223
¹ Eagle/Eagle	No telephone	² Sitka/Sitka	907-747-3374
³ Fairbanks/Fairbanks Intl	907-474-0307	^{1 2} Skagway/Skagway	907-983-2325
^{1 2} Hyder/Hyder SPB (Ketchikan)	907-225-2254	² Valdez	907-835-2355
² Ketchikan/Ketchikan Intl	907-225-2254	¹ Yukon/Ft Yukon (Fairbanks)	907-474-0307

¹ Indicates Flight Service notification to U.S. Customs not available. Flight notification service is available to airports not so marked.

² Indicates Landing Rights may be granted provided the aircraft is not subject to quarantine inspection by the U.S. Public Health Service. (Sec 71.46, P.H.S. Foreign Quarantine Regulations).

³ These are called International Airports but they are not so designated by Federal Agencies and permission to land is required.

HOURS OF SERVICE. — Regular business hours of U.S. Customs Offices are 0800-1700 Local time daily.

CIS AIRSPACE. — Special attention is required when operating aircraft near Russian airspace. (See map procedures section —Buffer Zone and Non Free Flying area and also Emergency Procedures section.)

CIVIL USE OF MILITARY FIELDS

LANDING AT AIR FORCE AIRFIELDS — Except for emergencies prior permission is required for use of Air Force airfields. Information relevant to the submission of the requests, insurance requirements, landing fees, etc. may be obtained from Headquarters, 611th Air Support Squadron, 10471 20th St, Suite 201, Elmendorf AFB, AK 99506, telephone 907-552-1448. Civil aircraft landing permit applications for Air Force airfields in Alaska must be submitted to the above address a minimum of 15 days prior to first intended landing to ensure timely return of the landing permit if approved (permit must be on board aircraft for presentation upon landing). Civil aircraft landing applications for Air Force airfields outside the state of Alaska must be submitted to HQ USAF/XOO-CA, 1480 Airforce Pentagon RM 4D1010, Washington, DC 20330-1480, telephone 703-697-5967, fax 703-695-7004 a minimum of 30 days prior to first intended landing. Civil aircraft landing without prior authorization may experience extensive delays in departure and will be assessed special landing fees.

LANDING AT U.S. ARMY AIRFIELDS — Except for emergencies, prior permission is required and should be requested from the installation commander via the operations officer of the airfield concerned.

For Navy and Marine Corps Installations, prior permission should be requested at least 30 days prior to first intended landing, either from the Chief of Naval Operations (OP-513E) or the Commanding Officer of the field concerned (who has the authority to approve landing rights for certain categories of civil aircraft). An Aviation Facility License must be approved and executed by the Navy prior to any landing by civil aircraft.

For Coast Guard fields prior permission should be requested from the Commandant, U.S. Coast Guard via the Commanding Officer of the field.

When instrument approaches are conducted by civil aircraft at military airports, they shall be conducted in accordance with the procedures and minimums approved by the military agency having jurisdiction over the airport.

PARACHUTE JUMPS ONTO AIRPORTS

Pilots of jump aircraft and parachutists are reminded that Federal Aviation Regulations, Part 105, requires prior approval from airport management to parachute jump onto airports. Written approval to jump onto state-owned airports must be obtained 72 hours in advance from the Director, Division of Aviation, 4111 Aviation Ave. Anchorage, Alaska 99502.

MAGNETIC COMPASS DEVIATIONS

Extreme variations in compass deviations may be experienced due to magnetic storms at geographic latitudes greater than 60° N. The variations may have duration of several minutes to several hours and cause compass swings of 5-10°. The National Oceanic and Atmospheric Administration's Environmental Research Lab high latitude monitoring station at Elmendorf AFB provides present and forecast conditions daily. This information summary may be obtained by calling 566-1819.

USE OF RADIO ALTIMETERS

Pilots flying aircraft equipped with SCR-718 radio altimeters will assure that the altimeter is turned off within 200 NM of Clear MEWS, Alaska.

USE OF GPS DURING OUTAGE OR SERVICE LIMITATION OF VHF OMNI-DIRECTIONAL RANGE, (VOR) LAND-BASED EN ROUTE NAVIGATION AIDS

Purpose.

Due to inaccessibility, the FAA cannot always repair navigation aids in Alaska in a timely fashion. Such outages or service limitations, can have a dramatic effect on commerce, as air transportation is frequently the only means of travel. This notice is intended to provide some relief by using the Global Positioning System (GPS).

Operations.

Subject to the restrictions below, operators are authorized to use GPS equipment to navigate over portions of established routes that are affected by the temporary outage or service limitation of VOR land-based en route navigation aids.

Restrictions.

1. Properly installed IFR GPS equipment must be used.
2. There must be 23 or more GPS satellites operating. Outages of GPS satellites are published in NOTAMs. If less than 23 satellites are available, the operation can only be conducted if receiver autonomous integrity monitoring (RAIM) is predicted to be available over the associated portion of the flight plan. Owners of GPS equipment should contact their vendors to obtain information on performing this prediction.

Detection of Failures.

GPS equipment normally includes failure indications, but it is still necessary for the crew to make frequent comparison checks. If the GPS equipment alerts that RAIM is not available, cross-check to other available navigation equipment should be conducted rigorously. When RAIM is not available, the equipment cannot guarantee that it will detect failures in the GPS satellites.

RADIATION AREAS

Aircraft should avoid the following areas:

Radiation hazard area from SFC to 16,000' MSL for aircraft out to 3 NM with externally mounted electro explosive devices (EED). Possible interference with electronic equipment for aircraft above 200 feet MSL out to 3 NM (military) or 62 NM (civilian) from a phased array antenna on NW corner of Shemya Island (52°44'N 174°05'E) on a bearing of 250° thru 028°T. These are parameters for information only.

RF radiation area from 100 feet AGL to 5000 feet MSL within a 5000 feet radius of Clear BMEW radar site.

AERONAUTICAL RADIO, INC (ARINC)

(Services available for aircraft engaged in international flight)

ARINC using Pacific common air/ground ATC frequency networks shared with other ground stations are listed below. The frequencies in use will depend on the time and conditions which affect radio propagation. International flights on the ground at ANC or within VHF range of the SEA-ANC network that are entering the NOPAC Route System within Anchorage Centers FIR boundary should contact ARINC on VHF 129.4 to obtain primary/secondary HF frequencies and verify SELCAL before entering NOPAC. If unable 129.4, primary/secondary HF frequencies may be obtained from Anchorage ARTCC, but no SELCAL is available.

CENTRAL WEST PACIFIC (CWP) NETWORK FREQUENCIES

San Francisco

MWARA — 2998, 4666, 6532, 8903, 11384, 13300, 17904 and 21985 kHz

LDOCF (C) — 3013, 6640, 11342, 13348, 17925, and 21964 kHz

NORTH PACIFIC (NP) NETWORK FREQUENCIES

San Francisco

MWARA — 2932, 5628, 5667, 6655, 8915, 8951, 10048, 11330, 13273, 13339, 17946 and 21925 kHz

LDOCF (C) — 3013, 6640, 11342, 13348, 17925, and 21964 kHz

CENTRAL EAST PACIFIC ONE (CEP-1) NETWORK FREQUENCIES

San Francisco

Extended Range VHF (A) — 131.95

MWARA — 3413, 5574, 8843, 13354, 3452, 6673 and 10057 kHz

LDOCF (C) — 3013, 6640, 11342, 13348, 17925, and 21964 kHz

Seattle

Pre-flight checks (B) — 5574 kHz

CENTRAL EAST PACIFIC TWO (CEP-2) NETWORK FREQUENCIES

San Francisco

Extended Range VHF (A) — 131.95

MWARA — 2869, 5547, 11282, and 13288 kHz

LDOCF (C) — 3013, 6640, 11342, 13348, 17925, and 21964 kHz

Seattle

Pre-flight checks (B) — 5574 kHz

SOUTH PACIFIC (SP) NETWORK FREQUENCIES

San Francisco

MWARA — 3467, 5643, 8867, 13261, and 17904 kHz

LDOCF (C) — 3013, 6640, 11342, 13348, 17925, and 21964 kHz

SSB capability available on all HF freqs. (A) Extended Range VHF. Coverage includes area within approximately 200 NM of the Hawaiian Islands and along the Hawaii–Mainland US tracks extending outward approximately 250 NM from the HNL, SFO, and LAX areas. (B) Call ARINC on 129.85 VHF to arrange HF checks. 129.40 available for enroute communications on SEA–ANC routes. (C) Users are reminded that all transmissions on the ARINC HF SSB LDOCF must be in the single sideband mode (upper sideband only). Phone patch service will be available as a normal part of the service. Communications are limited to aircraft operational control matters. Public correspondence (personal messages) to/from crew or passengers cannot be accepted. Refer questions to ARINC operations at 410–266–4430.

Aircraft operating in the Anchorage Arctic CTA/FIR beyond line of sight range of remote control VHF air/ground facilities operated from the Anchorage ARTCC, shall maintain communications with Gander Radio and a listening or SELCAL watch on HF frequencies of the North Atlantic D (NAT D) network (2971 kHz, 4675 kHz, 8891 kHz and 11279 kHz). Additionally, and in view of reported marginal reception of the Honolulu Pacific VOLMET broadcasts in that and adjacent Canadian airspace, Gander Radio can provide Anchorage and Fairbanks surface observations and terminal forecasts to flight crews on request.

SATCOM VOICE AVAILABLE AS ALTERNATIVE COMMUNICATIONS MEDIUM:

ARINC has operational use of SATCOM Voice as an acceptable alternative communications medium for oceanic long range ATC communications. It is intended that SATCOM Voice will augment HF radio, in that HF will remain primary for all air-ground-air communications between ARINC Communications Centers and enroute oceanic aircraft. Aircraft desiring to contact an ARINC Communications Center should use the following INMARSAT Security Numbers to call the appropriate ARINC Center:

<u>Oceanic Area</u>	<u>Center</u>	<u>INMARSAT Number</u>	<u>Public Telephone Number</u>
Pacific	SFO	436625	925–371–3920

ARINC will also utilize SATCOM Voice as a normal operational backup to HF to initiate communications from ground-to-air on the rare occasion when HF communications cannot be established in a timely manner. SATCOM Voice may be used for either ATC or AOC (Aeronautical Operation Control) Communications. This capability will be on a "search, find and contact" basis initially, which may require some delay in contacting flights. Aircraft operators with aircraft currently cockpit SATCOM Voice equipped should contact ARINC at 1–410–266–4430 to provide, update, or verify aircraft AES ID codes which are required to initiate ground-to-air calls.

Direct SATCOM Voice communications is available with Anchorage Center for distress and urgency situations only. Information regarding SATCOM Voice is contained in Communications and Position Reporting, below.

THE NOPAC ROUTE SYSTEM

I. GENERAL

NOPAC traffic flows are predictable due to consumer demand, time zone differences, winds aloft and airport noise restrictions. Eastbound air traffic is heavy between 0700Z and 2100Z. Westbound air traffic is heavy between 1200Z and 1900Z, and between 2200Z and 0700Z. When the NOPAC Route System is selected as the preferred routing due to winds aloft, route saturation can occur. The most critical altitudes are flight levels 310 through 390. The lack of available preferred altitudes may necessitate destination decisions due to the vast route lengths involved.

II. NOPAC SYSTEM

The NOPAC Route System is comprised of five (5) Air Traffic Service (ATS) routes which transit the North Pacific between Alaska and Japan. The two (2) northern routes are used for westbound traffic. The three (3) southern routes are used primarily for eastbound traffic except that R591 or G344 may be used for westbound aircraft crossing the Tokyo/Anchorage Flight Information Region (FIR) boundary between 0000Z and 0600Z.

III. ROUTES

R220: One-Way Westbound, Even Altitudes FL180 to FL400, also FL330, FL350, FL370, FL390, FL410

R580: One-Way Westbound, Even Altitudes FL180 to FL400, also FL350, FL370

A590: One-Way Eastbound, Odd Altitudes FL190 to FL410, also FL300, FL320, FL340

R591: Two-Way; Odd Altitudes Eastbound, Even Altitudes FL300 to FL400 Westbound. Also FL300, FL320 and FL340 available Eastbound when route is part of published Eastbound PACOTS and FL350, FL370 and FL390 available Westbound when route is part of published Westbound PACOTS.

G344: Two-Way, Odd Altitudes Eastbound, Even Altitudes FL300 to FL400 Westbound. Also FL300, FL320 and FL340 available Eastbound when route is part of published Eastbound PACOTS and FL350, FL370 and FL390 available Westbound when route is part of published Westbound PACOTS.

NOTE: Radial/DME cross checks are available as follows:

for NATES on R220: SYA 329R/152DME

for ONEIL on R580: SYA 329R/102DME

for PINSO on A590: SYA 329R/052DME

for CHIPT on G344: SYA 148R/100DME

IV. TRANSITION ROUTES

Within the Tokyo FIR, Oceanic Transition Routes (OTRs) and, in one case, a Victor route, have been established for aircraft transitioning to or from the NOPAC Route System. Within the Anchorage FIR, certain ATS routes are used for the same purpose. These routes include: **6583, B327, B327 (For westbound use only between BAMOK and SELDM), R341, G469, A342, G215, R330, R451, R336, R338, G349 (For westbound use only).**

V. NOPAC REROUTES

Aircraft cannot always be accommodated on their flight planned NOPAC route. In an effort to reduce both coordination time and coordination errors, JCAB (Fukuoka ATMC) and FAA (Anchorage ARTCC) have agreed on a common procedure to accommodate most reroutes. Aircraft rerouted from one NOPAC ATC route to another NOPAC ATC route will be given short range clearances into the adjoining FIR's RADAR coverage airspace. The receiving ATC facility will then issue further routing to the aircraft prior to the aircraft reaching the clearance limit. **Example 1:** aircraft ABC101 is routed via R220 to RJTT but can not be accommodated on R220. The aircraft may be re-cleared as follows: "ABC101 cleared to OATIS via R580, expect further clearance from ATMC after OMOTO." **Example 2:** aircraft ABC102 is routed via A590 to PAFA but can not be accommodated on A590. The aircraft may be re-cleared as follows: "ABC102 cleared to SYA via R591, expect further routing from Anchorage ARTCC after AKISU."

VI. SEPARATION STANDARDS

VERTICAL – Reduced Vertical Separation Minima (RVSM) is applied from FL290 to FL410 inclusive in all of the Anchorage FIRs, i.e. Anchorage Domestic, Oceanic and Arctic Flight Information Regions. RVSM aircraft are separated by 1000 feet vertical spacing within this stratum. Non-RVSM aircraft are separated from *all* other aircraft, both RVSM and Non-RVSM, by 2000 feet within this stratum.

LATERAL – The primary form of lateral separation within the NOPAC Route System is 25 NM lateral either side of centerline, based on Required Navigation Performance 10 (RNP-10). (See FAA Order 8400.12 for the aircraft approval process.) Non-RNP10 aircraft, and all aircraft operating below FL180, are provided standard oceanic separation (50 NM either side of centerline). Non-RNP10 aircraft operating on published NOPAC routes at or above FL300 may be provided composite separation (25 NM either side of centerline with 1000 foot vertical separation from any aircraft occupying an adjoining route where standard longitudinal (i.e. "in trail") separation is not available.

A combination of 50 NM lateral, based on RNP-10, and standard oceanic separation may be also be applied between aircraft pairs where one aircraft has RNP-10 approval and the other does not. The minimum lateral separation between aircraft on adjacent tracks in this case is 75 NM—one half the lateral protected airspace for each aircraft.

As noted above, standard oceanic separation will be applied between non-RNP 10 aircraft at any altitude and may be applied between all aircraft operating below FL180 unless radar service is being provided or the aircraft is within domestic control areas where domestic non-radar control procedures are applied, as in Control 1234.

LONGITUDINAL – Within the Anchorage Oceanic FIR aircraft will be provided standard oceanic longitudinal separation, i.e. 15 minutes "in trail." This standard separation may be reduced to 5 minutes when the ICAO recognized "MACH Number Technique" is utilized. Additionally, Anchorage ARTCC has been authorized to conduct a trial of the "10 minute longitudinal

standard” within its Oceanic FIR. This last standard is applied regardless of the application of MACH Number Technique. In the near future Anchorage ARTCC will begin providing Automatic Dependent Surveillance – Contract (ADS-C) separation minima.

Within the Anchorage Domestic FIR, which for this discussion includes Control Areas 1234H and 1487H and the Norton Sound High Control Area, Anchorage Center utilizes the standard domestic separation minima of 10 minutes between aircraft. This separation may be reduced via other standard or special procedures. For example, Anchorage ARTCC has been authorized to utilize reduced DME/RNAV longitudinal separation for brief periods when aircraft are beyond normal VHF coverage. This procedure permits the separation of aircraft by 30 DME or 40 RNAV miles for periods beyond VHF coverage (i.e. beyond direct pilot/controller communications) for 90 minutes or less.

FLIGHT PLANS and PREFERRED ROUTES

I. Flight Plans

All operators planning IFR flight operations in the Anchorage Oceanic and Domestic Flight Information Regions west of 165° west longitude and south of 63° north latitude must file flight plans with both PAZAZQZX and PAZNZQZX. Failure to file with both system addresses may result in delay of ATC services.

Aircraft shall enter “W” in item 10 of the ICAO flight plan if the aircraft and operator have been approved for RVSM operations, in accordance with ICAO Doc 4444. Aircraft not approved for RVSM operations shall not enter “W” in item 10.

Aircraft shall enter “R” in item 10 of the ICAO flight plan if the aircraft and operator have been approved for RNP operations in accordance with ICAO Doc 4444 for the route of flight. Aircraft not approved for RNP operations shall not enter “R” in item 10.

All aircraft flight planned to cross the Anchorage/Tokyo FIR shall be established on a NOPAC route prior to the FIR. Aircraft operating beneath the NOPAC (at or below 17,000 MSL) may flight plan via random routes. To provide Control Centers with information on intended route of flight, all operators are requested to include the following data in the route definition portion of random flight plans involving flight in the Pacific Flight Information Regions under the jurisdiction of the U.S. Federal Aviation Administration.

- A. Coordinates of all turning points
- B. Names, where applicable, or coordinates of points associated with transition from oceanic control areas to airways or areas where national procedures apply
- C. Names of airways or descriptions of routes within such national airspace
- D. Coordinates for each 5° or 10° of latitude, or for each 5° or 10° of longitude, depending on the predominant direction of flight. 10° increments should only be used when the speed of the aircraft is such that 10° will be traversed within 1 hour 20 minutes.

Operators in the NOPAC Route System are reminded that flight plans must be filed in accordance with ICAO procedures and formats. This will allow for automatic flight data processing at oceanic control centers and oceanic radio stations along the route.

Flights originating outside of Anchorage or Tokyo regions and entering oceanic airspace without intermediate stops should submit flight plans as early as possible.

In addition to the normal requirement of addressing the flight plan to all control centers en route, associated oceanic radio stations should also be addressed. This will provide those stations with information such as flight identification, SELCAL, aircraft registration, destination, and ETA, which is necessary to handle the traffic. A properly addressed flight plan, formulated in accordance with ICAO standards, will be processed automatically by oceanic centers.

When flight planning via transition tracks and/or ATS routes, list the point of entry, followed by the route designator, and finally the point of exit, e.g., KATCH – B327 – NULUK – R220 – NANAC.

To minimize flight crew and controller workload, information should be carried for routes other than the one being flown. This material should include route data, reporting points, fuel burn, winds aloft, time enroute, etc., for those routes compatible with the direction of flight. Data for routes R591 and G344 should also be carried regardless of the direction of flight as they are used for both eastbound and westbound traffic. Carrying this information will avoid unnecessary delays in the event a route or flight level other than that filed in the original flight plan is assigned by ATC. Readily available material will facilitate timely crew decisions as to their preference of alternate routes or altitudes.

II. Preferred Routes

Anchorage ARTCC will periodically issue International NOTAMs specifying the preferential routes to be flown within the Anchorage FIR. Each NOTAM will individually denote, during specified time periods, either the westbound or eastbound tracks. Flights filed contrary to these NOTAM’s or preferred routes may expect reroutes, sequencing delays, and/or severe altitude restrictions for same direction, crossing, or opposite direction traffic.

Aircraft must have RVSM and RNP 10 approval from the appropriate State authority to operate in the NOPAC between FL290 and FL410 inclusive. Operators who do not have approval should see section D, “Exceptions,” below.

A. WESTBOUND

1. Aircraft entering the NOPAC Route System may use:
 - a. R220 at all times utilizing even cardinal altitudes from FL180 to FL400 and FL330, FL350, FL370, FL390, FL410. Above FL410, altitudes will be assigned as per ICAO Annex 2, Appendix 3b.
 - (1) Flights departing PANC or PAED shall flight plan NODLE thence R220.
 - (2) Flights departing from all other airports within the Anchorage FIR and flights crossing the Edmonton/Anchorage FIR shall flight plan: OME R338 NATES R220, ENM direct NOLTI (or any route which will keep the aircraft south of ENM and north of NOSHO until joining R220 at NOLTI), or NEONN (or any fix east of NEONN on R220) thence R220.

- (3) Flights crossing the Vancouver/Anchorage FIR or the Oakland/Anchorage FIR shall flight plan one of the following: NOLTI (or any fix east of NOLTI on R220) thence R220, or ONEOX B327 NULUK R220 or via the daily Westbound PACOTS Track message.
- (4) Flights utilizing R338 NATES R220, between 2200Z and 0300Z shall be able FL370 by 100NM southwest of OME. Flights unable to meet this restriction shall advise ATC as soon as possible for a reroute to R220 due to crossing non-radar traffic.
- b. R580 at all times utilizing even cardinal altitudes from FL180 to FL400 and FL350 and FL370 with the following guidelines:
 - (1) Aircraft departing PANC or PAED shall flight plan NODLE R220 NICH0 thence R580.
 - (2) As specified in the daily westbound PACOTS track message.
 - (3) Flight plan route ORVIL (or any fix east of ORVIL on R580) thence R580.
- c. R591 utilizing even cardinal altitudes from FL300 to FL400 with the following guidelines:
 - (1) As specified in the daily Westbound PACOTS track message.
 - (2) Must cross AKISU between 0000Z and 0600Z.
- d. G344 utilizing even cardinal altitudes from FL300 to FL400 with the following guidelines:
 - (1) As specified in the daily Westbound PACOTS track message.
 - (2) Must cross CUTEe between 0000Z and 0600Z.
 - (3) When R591 is designated as a Westbound PACOTS track, but G344 is not, G344 will be available eastbound at and below FL290 only, between 2200Z and 0600Z.
- 2. Due to route crossing in a non-radar environment, westbound arrivals destined for RJCC (Sapporo/New Chitose), RJCH (Kakodate), or RJSM (Misawa), as well as other westbound aircraft leaving the NOPAC Route System via V51, must file via R220.

B. EASTBOUND

- 1. Aircraft transitioning the NOPAC Route System eastbound to North America or Europe may use:
 - a. A590 at all times utilizing odd cardinal altitudes from FL190 to FL410 and FL300, FL320 and FL340. Above FL410, altitudes will be assigned as per ICAO Annex 2, Appendix 3b.
 - b. R591 at all times unless it has been designated as a Westbound PACOTS track. R591 is then available eastbound between 0900Z and 2100Z. Odd cardinal altitudes FL190 and FL410 are utilized. Above FL410, altitudes are assigned as per ICAO Annex 2, Appendix 3b.
 - c. G344 at all times unless it or R591 has been designated a Westbound PACOTS track. G344 is available eastbound from 0900Z to 2100Z only, if it has been designated a Westbound PACOTS track. When R591 is designated a westbound PACOTS track but G344 is not, G344 will be available eastbound at and below FL290 only, between 2200Z and 0600Z.

C. TWO-WAY ROUTES (check the North America–Japan PACOTS Track Message for daily route usage):

- 1. R591 may be used as a westbound track for flights crossing AKISU between 0000Z and 0600Z when designated as a Westbound PACOTS track. R591 is closed to all traffic from 2101Z to 2359Z and from 0601Z to 0859Z when designated as a Westbound PACOTS track.
- 2. G344 may be used as a westbound track for flights crossing CUTEe between 0000Z and 0600Z when designated as a Westbound PACOTS track. G344 is closed to all traffic from 2101Z to 2359Z and from 0601Z to 0859Z when designated as a Westbound PACOTS track. G344 is closed to eastbound traffic at or above FL310 from 2000Z to 0600Z when R591 is designated as a Westbound PACOTS track.

D. RESTRICTIONS

- 1. An aircraft must not transition from one NOPAC Route to another except under the following conditions:
 - a. The aircraft is on a published PACOTS track or,
 - b. The aircraft is abeam or east of SPY.
- 2. An aircraft flying a published eastbound PACOTS track must not diverge from that PACOTS track until it is abeam or east of SPY.
- 3. An aircraft transitioning the NOPAC during the Eastbound PACOTS period, not participating in the PACOTS, must remain on or north of the northern-most PACOTS track.

E. EXCEPTIONS

- 1. **Civil aircraft.** not approved for RVSM operations and unable to fly to an appropriate destination at or below FL280 or at or above FL430, may flight plan at RVSM flight levels in the RVSM stratum provided the aircraft*:
 - a) is being initially delivered to the State of Registry or Operator, or
 - b) was formerly RVSM approved but has experienced an equipment failure and is being flown to a maintenance facility for repair in order to meet RVSM requirements and/or obtain approval; or
 - c) is being utilized for mercy or humanitarian purposes.
- 2. Civil aircraft requesting approval as above shall:
 - a) if departing within the Anchorage FIR, or if Anchorage ARTCC is the first Oceanic control facility along the route of flight, obtain approval from Anchorage ARTCC Traffic Management Unit (TMU) normally not more than 12 hours and not less than 4 hours prior to the intended departure time; or
 - b) if entering the Anchorage FIR from another Oceanic FIR, notify the Anchorage ARTCC TMU after approval is received from the first affected Oceanic Center and prior to departure (Note: Filing the flight plan is not appropriate notification) and
 - c) include the remarks "APVD non-RVSM" in Field 18 of the ICAO Flight Plan.

Contact details for approval request or notification are as follows:

Anchorage ARTCC TMU
Tel: 1-907-269-1108

Fax: 1-907-269-1343

AFTN: PAZAZQZX

*NOTE: This approval process is intended exclusively for the purposes indicated above and not as a means to circumvent the normal RVSM approval process. Non-RVSM aircraft operating in the RVSM stratum will be separated from all other aircraft by a minimum 2000 ft vertical separation. It should be noted that RVSM approved aircraft will be given priority for level allocation over non-RVSM approved aircraft. ATC may clear non-RVSM approved aircraft to climb or descend through RVSM airspace, provided they do not climb or descend at less than the standard rate, or level off while passing through the RVSM stratum.

2. **Non-RVSM** State aircraft (military, customs, police service, etc.) requesting approval to operate in RVSM airspace shall follow the procedures outlined above the Civil Aircraft except as follows:
 - a) Non-RVSM state aircraft may flight plan at RVSM flight levels in Oakland, Anchorage, Tokyo and Naha's airspace without prior coordination. State aircraft should include in the remark section "STS/Military NON-RVSM" in field 18 of the ICAO flight plan.
3. **Non RNP10** Aircraft. Aircraft not approved for RNP-10 operations are restricted to flight planning one of the following NOPAC routings.
 1. Westbound on R220 at all times.
 2. Eastbound on A590 at all times.
 3. Eastbound on G344 when available for eastbound flights.

The altitudes available on the above routes are at or below FL280 and at or above FL430. ATC may reroute non-RNP 10 aircraft to other than the above routes due to traffic.

COMMUNICATIONS and POSITION REPORTING

I. General

ICAO Annex 6 Part II contains standards and recommended practices adopted as the minimum standards for all airplanes engaged in general aviation international air navigation. It requires that those airplanes, operated in accordance with Instrument Flight Rules, on a controlled VFR flight plan, or at night, have installed and approved radio stations and monitor such frequencies as may be prescribed by the appropriate authority.

II. High Frequency (HF) Communications

Most North Pacific area communications are conducted on HF single sideband. Pilots communicate with control centers via oceanic radio stations. Aircraft reports, requests, and messages are relayed by the station to the appropriate air traffic control center by interphone, computer display, or teletype message. The relay function, coupled with the need for intercenter coordination, may cause delays in the handling of routine aircraft requests. There are priority message handling procedures for processing urgent messages which reduce any time lag; however, flight crews should take possible delays into consideration when requesting step climbs, reroutes, or other routine requests requiring ATC action. Delays can be reduced through advanced planning of such requests.

Due to the inherent "line of sight" limitations of VHF radio equipment when used for communications in international oceanic airspace, those aircraft operating on an IFR or VFR controlled flight plan beyond the communications capability of VHF will be required as per ICAO Annex 2, to maintain a continuous listening watch and communications capability on the assigned HF frequencies. An operable SELCAL unit or similar automatic signalling device fulfills this requirement. The applicable HF frequencies are listed earlier in this Supplement as part of the general purpose communication facilities operated by Aeronautical Radio, Inc. (ARINC). These facilities will be responsible for the relay of position reports and other pertinent information between the aircraft and Air Traffic Control or their respective operators.

Aircraft should establish communications with the appropriate oceanic radio station upon entering the FIR. The station will advise the aircraft of the primary and secondary HF channels in use. If possible, aircraft should monitor both of these frequencies. If the aircraft has only single HF capability, the primary should be guarded with the secondary being the first frequency checked in the event of lost communications. If the SELCAL unit is working at the time of the initial contact, the aircraft may maintain a SELCAL watch on the appropriate frequency(ies). If the SELCAL unit is inoperative or if the radio station has a malfunctioning SELCAL transmitter, the aircraft shall maintain a listening watch on the appropriate North Pacific frequency.

III. Guard Station

Pilots are reminded that there is a need to continuously guard the VHF emergency frequency 121.5 MHz when on long over-water flights, except when communications on other VHF channels, equipment limitations, or cockpit duties prevent simultaneous guarding of two channels. Guarding of 121.5 MHz is particularly critical when operating in proximity to FIR boundaries, (route R220 between Anchorage and Tokyo, for example) since it serves to facilitate communications with regard to aircraft which may experience inflight emergencies, communications, or navigation difficulties.

The oceanic radio station guarding for flight operations will normally be the station associated with the air traffic control center responsible for the FIR, i.e., San Francisco ARINC for the Anchorage FIR and Tokyo Radio for the Tokyo FIR. At the FIR boundary the responsibility for the guard will, under normal signal conditions, be changed to the station associated with each new FIR. The flight crew must ensure that they have established communications with the new guard facility.

Normally, each oceanic radio station continuously monitors all assigned frequencies. If en route HF communications fail, every effort should be made by the flight crew to relay progress reports through other aircraft. The VHF frequency 123.45 MHz is for exclusive use as an air-to-air communications channel (see paragraph IV.B. below). In emergencies, however,

initial contact for such relays may be established on 121.5 MHz (the emergency frequency guarded by all aircraft operating in the oceanic airspace) and transferred as necessary to 123.45. In normal HF propagation conditions, appropriate overdue action procedures will be taken by ATC in the absence of position reports or relays. In all cases of communications failure, the pilot should follow the oceanic clearance last received and acknowledged.

IV. VHF Communications

A. Air-to-ground:

Oceanic radio stations will normally have VHF capability within 200 nautical miles of their geographic location. The frequency is listed in the appropriate publications. This frequency may be used prior to departure from the adjacent international airport to establish communications with the radio station, or for aircraft operating within range, to relay progress reports or other messages to their company's operations.

B. Air-to-air:

Frequency 123.45 MHz has been designated for use in air-to-air communications between aircraft operating in the Pacific area out of range of VHF ground stations to exchange operational information and facilitate resolution of operational problems. (See paragraph III. above.)

C. The normal VHF (119.1 MHz) initial contact points with Anchorage ARTCC for eastbound flights established in the NOPAC are:

1. On A590, 150NM west of PINSO.
2. On R591, 150NM west of Shemya (SYA).
3. On G344, 150NM west of CHIPT.

NOTE: Initial contact may be attempted on 128.2 MHz as a backup to 119.1.

D. Westbound PACOTS flights will be advised of the appropriate Anchorage ARTCC VHF frequency by San Francisco ARINC.

V. Satellite Voice System

Satellite Voice System (SATCOM Voice) is available at Anchorage Center. Direct SATCOM Voice contact between the flight crew and Anchorage Center shall be limited to distress and urgency situations, or other exceptional circumstances only. All routine communications should be conducted via VHF or through ARINC via either HF or SATCOM Voice. Flight crews should log onto the INMARSAT Pacific Ocean Satellite while operating anywhere within the Anchorage FIR at or south of 75N latitude. This will allow ATC to contact the aircraft when other means are not available and communication is essential. Flight crews are reminded that during long flights across the Pacific and Indian Ocean regions a loss of signal may occur at approximately 145E. The flight crew should verify logon to the correct Ocean Region satellite.

Aircraft satellite data units may be preprogrammed with the INMARSAT six digit code for easy call set-up. The INMARSAT code for Anchorage Center is 436602. If the aircraft provides direct dial access, the INMARSAT six digit code may be utilized for initiating air/ground communications. To receive SATCOM Voice service, the aircraft must already be logged onto an INMARSAT communications satellite. Direct SATCOM Voice calls to ATC should have one of the following ICAO priority levels:

1. Highest, distress or urgent situations.
2. Second highest, flight safety situations.

All other levels should be conducted through ARINC.

VI. Controller/Pilot Data Link Communications

Controller/Pilot Data Link Communications (CPDLC) service is operational throughout the Anchorage Oceanic and Domestic Flight Information Regions (FIRs). Anchorage ARTCC utilizes two separate enroute automation systems each having a different CPDLC (FANS) logon address. Use logon address PAZN for all CPDLC communications in the Anchorage Oceanic FIR and in that portion of the Anchorage Domestic FIR west of 165 degrees west longitude and south of 63 degrees north latitude. Use logon address PAZA for all other areas of the Anchorage Domestic FIR and the Anchorage Arctic FIR. Aircraft entering Anchorage FIR airspace from Canadian or Russian airspace are requested to logon at or prior to crossing the FIR boundary. Aircraft entering Anchorage FIR airspace from the Oakland or Fukuoka FIR will be provided automatic FANS addressing. Aircraft departing Alaskan airports are requested to logon after departure, but before leaving Flight Level 180. Flight crews are reminded that use of CPDLC does not remove requirements to monitor VHF/HF frequencies. Aircraft within VHF coverage may make position reports via CPDLC. Requests to ATC should be made via VHF if within VHF coverage. After logon, Anchorage ARTCC automation will provide automatic FANS address forwarding for flights entering the Magadan, Fukuoka and Oakland FIRs.

VII. Time and Place of Position Reports

A. When operating on a fixed route with designated compulsory reporting points: flight crews shall make standard position reports for those points.

B. When operating on a flexible route without designated reporting points:

1. flight crews navigating a generally east/west routing shall report over each 5° or 10° longitude (10° will be used if the speed of the aircraft is such that 10° will be traversed within 1 hour and 20 minutes or less).
2. flight crews navigating a generally north/south routing shall report over each 5° or 10° of latitude (based on aircraft speed as in B.1. above).

C. For flights operating in the Anchorage Oceanic and/or Anchorage Domestic FIR west of 165° west longitude.

1. All waypoints filed in part 15 of the ICAO flight plan (route field) must be reported as a standard position report.
2. Within this airspace position reports are to be made via ADS, CPDLC or voice communication in that order of preference.
3. In addition, aircraft with active ADS connections must make a CPDLC position report when crossing the Anchorage FIR boundary inbound to insure correct CPDLC connectivity.

300 NOTICES

4. In the event of VHF/HF or CPDLC position reporting, position reports are to be transmitted at the time of crossing the designated reporting point or as soon thereafter as possible.

VIII. Position Reports Prefix

When reporting to oceanic radio stations, the prefix "POSITION" should be used on initial call-up or prior to the text of the message. Keep in mind that the operator is typing the report into a teletype or computer terminal. It is imperative that the person transmitting the report speak slowly and distinctly, so that the message can be correctly copied on the first attempt.

IX. Position Report Contents

Position reports made to oceanic radio stations or on VHF directly to the ATC control facility shall be comprised of information on present position, estimated next position, and the next subsequent position in sequence as indicated below.

- A. "Present Position" shall include:
 1. The word "position".
 2. Aircraft identification.
 3. Reporting point name or, if not named:
 - a. For east-west flights:
 - 1) Latitude, in degrees, and minutes, and
 - 2) Longitude, in degrees only (in Tokyo FIR degrees and minutes).
 - b. For north-south flights:
 - 1) Latitude, in degrees only (in Tokyo FIR, degrees and minutes), and
 - 2) Longitude, in degrees and minutes.
 4. Time over reporting point in four digits.
 5. Altitude (flight level at which the aircraft is currently operating, plus the assigned altitude if other than the present altitude).
 6. Mach number being flown if assigned by ATC.
- B. "Estimated Next Position" shall include:
 1. Name of the next compulsory reporting point or, if not named, latitude and longitude (as in A.1.a. or A.1.b. above) and,
 2. Estimated time over the next reporting point. If the estimated time at the next point is found to be in error by 3 minutes or more from that notified to ATC, a revised estimate should be forwarded to Tokyo or Anchorage Center, as applicable, as soon as possible.
- C. "Next Subsequent Position" shall include the name (only) of the ensuing significant point along the route of flight after the "estimated next position" whether compulsory or not, or, if not named, latitude and longitude (as in A.1.a. or A.1.b. above).

X. Altitude Reports

Report reaching any assigned altitude within RVSM airspace unless radar identified.

XI. Weather Reporting Procedures

To minimize radio frequency congestion, routine weather reports such as winds and temperature, and fuel remaining information should not be included in position reports made directly to Anchorage ARTCC unless specifically requested. Weather reports shall be included as provided from weather reporting by the Weather Service and/or Air Traffic Service.

XII. Radar Coverage

The vast majority of the NOPAC Route System within the Anchorage FIR extends beyond the coverage of normal ATC radar. Present radar capability is limited to sites at St. Paul Island, Cold Bay and Shemya Island, each with an approximate range of 200NM.

The radar sites at St. Paul and Shemya Islands are secondary only. Unlike primary radar, secondary radar can only receive information on aircraft with an operating transponder; it cannot paint a target based on a radar echo from the aircraft's skin. Therefore, aircraft transitioning through the radar environment with an inoperable transponder may expect severe altitude restrictions until established on their cleared NOPAC Route.

GENERAL PROCEDURES

I. Peak Traffic Constraints

Peak traffic periods are:

- Eastbound – 0700Z to 2100Z
- Westbound – 1200Z to 1900Z and
- Westbound – 2200Z to 0800Z

Due to traffic volume, especially westbound, flights desiring to operate contrary to the predominant traffic flow can expect to be rerouted or assigned less than optimum flight levels.

If feasible, users planning to operate in the NOPAC Route System at airspeeds below MACH 0.78 should use other than the peak hours for their flights. Westbound flights can expect less than optimum flight levels at most times due to route saturation. This will reduce congestion and expedite traffic.

II. Transponder Codes

For eastbound flights, Anchorage ARTCC will assign a discrete code upon initial direct communications. The normal contact points are 150NM west of PINSO, 150NM west of SHEMA (SYA) and 150NM west of CHIPT, depending on the route of flight (see Section 3, paragraph IV.C.). If no discrete code is assigned, transponders should be set to Code 2000. For

westbounds, Anchorage ARTCC will normally assign the Mode 3/A Code 2000 at the Anchorage/Fukuoka FIR boundary. If the pilot has not been given a position at which to squawk 2000, the transponder should be changed to 2000 when crossing 164E longitude.

In general, transponders should be set to Mode 3/A Code 2000 when operating between 145E and 170E when eastbound, and between 164E and 145E when westbound. This requirement is to prevent target swapping, upon entry into the new FIR's radar coverage, of discrete beacon codes with aircraft assigned the same codes.

MACH NUMBER TECHNIQUE

I. General

The term "MACH number technique" is used to describe the technique of clearing turbojet aircraft operating along the same route to maintain specified MACH numbers in order to maintain adequate longitudinal separation between successive aircraft at, climbing to, or descending to, the same flight level.

Information on the planned MACH number must be included in the flight plan by pilots intending to operate turbojet aircraft in oceanic airspace. For all flights, the planned true MACH number shall be specified in item 15 of ICAO flight plans (Example, M084). The true airspeed in knots equivalent to the planned MACH number in item 15 shall be specified in the remarks section of item 18, with the abbreviation TAS and four-figure group (Example, RMK/TAS 0489.)

II. Background

The principle objective of the use of MACH number technique is to achieve improved utilization of the airspace, generally through reduced longitudinal standards. On certain long oceanic route segments ATC has no means, other than position reports, of ensuring that the longitudinal separation between successive aircraft is not reduced below the established minima. Practical experience has shown that two or more turbojet aircraft, operating along the same route at the same flight level, and flying the same MACH number, are more likely to maintain a constant time interval between each other than when using other methods. This is due to the fact that the aircraft concerned are normally subject to approximately the same wind and air temperature conditions and minor variations in speed, which might increase or decrease the spacing between them, tend to be neutralized over long periods of flight.

III. Application Procedures

When Mach number technique is applied, the normal requirement for ATC to calculate estimated times for the passage of significant points by the aircraft along its track still remains. This is necessary for both the provision of longitudinal separation between aircraft and for coordination with adjacent ATC units. ATC must be provided with the necessary data to complete this task. Thereafter, intervention by ATC should normally not be necessary unless position reports indicate that longitudinal spacing may be deteriorating to the extent that it threatens the minimum being applied, or there is conflicting traffic.

In the application of MACH Number Technique, it is imperative that pilots adhere strictly to their assigned cruise MACH number at all times, including during any climbs and descents; unless a specific reclearance is obtained from the appropriate ATC unit. If an immediate temporary change in the MACH number is essential before a revised clearance can be obtained, due to turbulence, e.g., ATC must be notified as soon as possible that a change has been made.

INFLIGHT CONTINGENCIES

I. General

The following procedures for inflight contingencies in the NOPAC Route System are intended for guidance only. All contingencies cannot be covered, but these procedures provide for such cases as inability to maintain assigned flight level, aircraft performance, or pressurization failure. They are applicable primarily when rapid descent, turn-back, or both, are necessary. The pilot's judgment shall determine the sequence of actions taken, with regard to the specific circumstances.

If an aircraft, notwithstanding all action taken to adhere to the route specified in the ATC clearance, inadvertently deviates from this route, action should be taken to regain it as soon as reasonable and not farther than 200 nautical miles from the DR position at which the heading was altered to regain the route specified in the ATC clearance. Action to regain this route shall not be delayed in anticipation of obtaining an ATC reclearance.

In contrast to operations in the domestic radar environment, operations in most oceanic areas are based on "strategic" clearance procedures, wherein separation depends on each aircraft navigating accurately. Any navigation error which results in the aircraft straying from the centerline of its cleared route and beyond its protected airspace could create a significant hazard, since the error would not normally be observed by Air Traffic Control.

II. Basic Procedures

- A. If an aircraft experiences navigational difficulties, it is essential that the pilot inform ATC as soon as the condition is apparent so that appropriate action can be taken, as necessary, to prevent conflict with other aircraft.
- B. If an aircraft is unable to continue flight in accordance with its air traffic control clearance, a revised clearance shall whenever possible, be obtained prior to initiating any action, using the radio telephone distress or urgent signals as appropriate (see notes 1 and 2 below).

Note 1. Distress call ("MAYDAY", three times) alerts all listening parties of an emergency requiring priority handling and possible assistance from other sources.

Note 2. Urgency call ("PAN PAN", three times) alerts all listening parties of a special handling condition which will receive ATC priority for issuance of a clearance or assistance.

- C. If prior clearance cannot be obtained, an air traffic control clearance shall be obtained at the earliest possible time; and, in the meantime, the aircraft shall broadcast its position (including the ATS route designator) and intentions on 121.5 at suitable intervals until air traffic control clearance is received.

302 NOTICES

NOTE: In such circumstances, communication with certain stations on VHF may be practical, e.g., Anchorage Center on 118.5 at Cold Bay, 121.4 at Dutch Harbor, 119.1 or 128.2 at St. Paul Island, 119.1 or 128.2 at Shemya, or 126.4 at Adak.

- D. If unable to comply with the provisions of paragraph II.B. above, the aircraft should leave its assigned route by turning 90 degrees to the right or left, whenever this is possible. The direction of the turn should be determined by the position of the aircraft relative to the route system, i.e., whether the aircraft is outside, at the edge of, or within the system, and other known traffic, if appropriate.
- E. An aircraft able to maintain its assigned altitude should, nevertheless, climb or descend 500 feet while acquiring and maintaining in either direction, a track laterally separated by 15NM from its assigned route.
- F. An aircraft not able to maintain its assigned altitude should start its descent while turning to acquire and maintain in either direction a track laterally separated by 15NM from its assigned route. For subsequent level flight, a level should be selected which differs by 500 feet from those normally used.
- G. Diversion across the flow of traffic: Before commencing a diversion across the flow of traffic, the aircraft should, while maintaining the 15NM offset, expedite climb above or descent below levels where the majority of Pacific oceanic traffic operate (for example, to a level above FL400 or below FL290) and then maintain a level which differs by 500 ft (150 m) from those normally used. However, if the pilot is unable or unwilling to carry out a major climb or descent, the aircraft should be flown at a level 500 ft above or below levels normally used until a new ATC clearance is obtained.
- H. ETOPS Aircraft: If these contingency procedures are employed by a twin engine aircraft as a result of engine shutdown or a failure of an ETOPS critical system, the pilot should advise ATC as soon as practicable of the situation, reminding ATC of the type of aircraft involved and requesting expeditious handling.

PROCEDURES FOR WEATHER DEVIATIONS AND OTHER CONTINGENCIES IN OCEANIC CONTROLLED AIRSPACE

I. GENERAL

- A. The following procedures are intended to provide guidance. All possible circumstances cannot be covered. The pilot's judgment shall ultimately determine the sequence of actions taken and ATC shall render all possible assistance.
- B. If the aircraft is required to deviate from track and prior clearance cannot be obtained, an ATC clearance shall be obtained at the earliest possible time and in the meantime, the aircraft shall broadcast its position (including the ATS route designator or the track code, as appropriate) and intentions, on frequency 121.5 Mhz at suitable intervals until ATC clearance is received.
- C. The pilot shall advise ATC when deviation is no longer required, or when a deviation has been completed and the aircraft has returned to the centerline of its cleared route.

II. OBTAINING PRIORITY FROM ATC WHEN WEATHER DEVIATION IS REQUIRED.

- A. When the pilot initiates communications with ATC, rapid response may be obtained by stating "WEATHER DEVIATION REQUIRED" to indicate that priority is desired on the frequency and for ATC response.
- B. The pilot still retains the option of initiating the communications using the urgency call "PAN-PAN" 3 times to alert all listening parties of a special handling condition which will receive ATC priority for issuance of a clearance or assistance.

III. ACTIONS TO BE TAKEN: PILOT-CONTROLLER COMMUNICATIONS ARE ESTABLISHED.

- A. Pilot notifies ATC and requests clearance to deviate from track, advising when possible, the extent of the deviation expected.
- B. ATC takes one of the following actions:
 - 1. If there is no conflicting traffic in the horizontal dimension, ATC shall issue clearance to deviate from track.
 - 2. If there is conflicting traffic in the horizontal dimension, ATC separates aircraft by establishing vertical separation.
 - 3. If there is conflicting traffic and ATC is unable to establish standard separation, ATC shall:
 - a. Advise the pilot unable to issue clearance for requested deviation;
 - b. Advise the pilot of conflicting traffic; and
 - c. Request pilot's intentions.

PHRASEOLOGY: "UNABLE (requested deviation), TRAFFIC IS (call sign, position, altitude, direction), ADVISE INTENTIONS."

- C. The pilot will take the following actions:
 - 1. Advise ATC of intentions by the most expeditious means available.
 - 2. In the event that pilot/controller communications cannot be established or a revised air traffic clearance is not available, pilots will follow the procedures outlined in the Regional Supplementary Procedures, International Civil Aviation Organization Document 7030, and Chart Supplement.

IV. ACTIONS TO BE TAKEN IF A REVISED ATC CLEARANCE CANNOT BE OBTAINED.

- A. The pilot shall take the actions listed below under the provision that the pilot may deviate from rules of the air (e.g., the requirement to operate on route or track centerline unless otherwise directed by ATC), when it is absolutely necessary in the interests of safety to do so.
- B. If a revised air traffic control clearance cannot be obtained and deviation from track is required to avoid weather, the pilot shall take the following actions:
1. if possible, deviate away from an organized track or route system;
 2. establish communication with and alert nearby aircraft by broadcasting, at suitable intervals: flight identification, flight level, aircraft position (including the ATS route designator or the track code) and intentions (including the magnitude of the deviation expected) on the frequency in use, as well as on frequency 121.5 MHz (or, as a back-up, the VHF inter-pilot air-to-air, 123.45 MHz).
 3. watch for conflicting traffic both visually and by reference to ACAS (if equipped);
 4. turn on all aircraft exterior lights (commensurate with appropriate operating limitations);
 5. for deviations of less than 10NM, aircraft shall remain at the level assigned by ATC;
 6. for deviations of greater than 10NM, when the aircraft is approximately 10 NM from track, initiate a level change based on the following criteria:

Route Centerline track	Deviations > 10 NM	Level change
EAST	LEFT	DESCEND 300 ft
000 – 179 magnetic	RIGHT	CLIMB 300 ft
WEST	LEFT	CLIMB 300 ft
180 – 359 magnetic	RIGHT	DESCEND 300 ft

Note: Paragraphs B2 and B3 above call for the pilot to: broadcast aircraft position and pilot's intentions, identify conflicting traffic and communicate air-to-air with near-by aircraft. If the pilot determines that there is another aircraft at or near the same FL with which his aircraft might conflict, then the pilot is expected to adjust the path of the aircraft, as necessary, to avoid conflict.

7. if contact was not established prior to deviating, continue to attempt to contact ATC to obtain a clearance. If contact was established, continue to keep ATC advised of intentions and obtain essential traffic information.

8. when returning to track, be at assigned flight level, when the aircraft is within approximately 10 NM of centerline.

V. STRATEGIC LATERAL OFFSETS IN OCEANIC AIRSPACE TO MITIGATE WAKE TURBULENCE AND TO MITIGATE COLLISION RISK.

A. Pilots should use the Strategic Lateral Offset Procedure as standard operating practice in the course of normal oceanic operations to mitigate collision risk and wake turbulence. The Strategic Lateral Offset Procedures will be applied throughout the Oakland and Anchorage oceanic FIRs. This procedure is to be used for **both** wake vortex encounters, and to mitigate the heightened risk of collision when non-normal events such as operational altitude deviation errors and turbulence induced altitude deviations occur.

B. Strategic Lateral Offset Procedures will be applied using the following guidelines:

1. Strategic lateral offsets executed to mitigate collision risk and those executed to mitigate the effects of wake turbulence are to be made to the **right** of a route or track.
 2. In relation to a route or track, there are three positions that an aircraft may fly: centerline, 1 NM or 2 NM **right**; and,
 3. Offsets are not to exceed 2 NM **right** of centerline.
- C. The intent of this procedure is to reduce risk (increase the safety margin) by distributing aircraft laterally and equally across the three available positions. In this connection, pilots must take account of the following:
1. Aircraft without automatic offset programming capability **must** fly the centerline.
 2. Aircraft capable of being programmed with automatic offsets may fly the centerline or offset 1 NM or 2 NM right of centerline to obtain lateral spacing from nearby aircraft.
 3. Pilots should use whatever means are available (e.g. communications, visual acquisition, GPWS or TCAS/ACAS) to determine the best flight path to fly.
 4. Any aircraft overtaking another aircraft is to offset within the confines of this procedure, if capable, so as to create the least amount of wake turbulence for the aircraft being overtaken.
 5. For wake turbulence purposes, pilots are also to fly one of the three positions at B.2. above and never offset to the left of centerline nor offset more than 2 NM right of centerline.

NOTE: It is recognized that the pilot will use his/her judgment to determine the action most appropriate to any given situation and has the final authority and responsibility for the safety operation of the aeroplane. The use of air-to-air channel, 123.45, may be used to coordinate the best wake turbulence offset option.

6. Pilots may apply an offset outbound at the oceanic entry point but must return to centerline at the oceanic exit point.
7. Aircraft transiting radar-controlled airspace (e.g. Guam or Vancouver Center) may remain on their established offset positions but must advise the radar controller on initial contact of their offset status.
8. There is not ATC clearance required for this procedure and, except as stated in paragraph (g), above it is not necessary that ATC be advised; and,
9. Voice position reports are to be based on the current ATC route/course clearance and not the exact coordinates of the offset position.

RVSM

I. AIR WORTHINESS AND OPERATIONAL APPROVAL AND MONITORING.

- A. Operators Must obtain operational approval from the State of Registry or the State of the Operator, as appropriate, to conduct RVSM operations. On behalf of the Pacific Air Traffic Services Providers, the FAA is maintaining a website containing documents and policy for RVSM approval. The address is: www.faa.gov/ats/ato/rvsm1.htm. In the Pacific RVSM Documentation section, "Documents and Process for Pacific RVSM Aircraft and Operator Approval" provides an outline of approval process events with reference to related documents.
- B. If TCAS is installed in RVSM compliant aircraft, the equipment should be updated to Change 7, or later approved version, for optimum performance in RVSM airspace.
- C. An essential part of the implementation of RVSM is the ability to monitor aircraft height to ensure that the aircraft height-keeping performance standard is being met. The Asia Pacific Approvals Registry and Monitoring Organization (APARMO) will process the results of monitoring. For further information on RVSM monitoring the APARMO website is: www.tc.faa.gov/act500/rvsm/aparmo_intro.htm.

II. IN-FLIGHT PROCEDURES WITHIN RVSM AIRSPACE.

- A. Before entering RVSM airspace, the pilot should review the status of required equipment. (See Appendix 4 of FAA Interim Guidance 91–RVSM for pilot procedures.) The following equipment should be operating normally:
 1. two primary altimetry systems;
 2. one automatic altitude-keeping device; and
 3. one altitude-alerting device.
- B. The pilot must notify ATC whenever the aircraft:
 1. is no longer RVSM compliant due to equipment failure; or
 2. experiences loss of redundancy of altimetry systems; or
 3. encounters turbulence that affects the capability to maintain flight level.
 (See Appendix 5 of FAA Interim Guidance 91–RVSM for pilot and controller actions in such contingencies.)
- C. During cleared transition between levels, the aircraft should not overshoot or undershoot the assigned FL by more than 150 ft (45 m).
- D. Pilot Level Call. Except in an ADS or radar environment, pilots shall report reaching any assigned altitude within RVSM airspace.

III. Suspension of RVSM

Air traffic services will consider suspending RVSM procedures within affected areas of the Anchorage FIR when there are pilot reports of greater than moderate turbulence. Within areas where RVSM procedures are suspended, the vertical separation minimum between all aircraft will be 2000 ft.

NAVIGATION PERFORMANCE

Any operation which is conducted in international oceanic airspace on an IFR flight plan, a VFR controlled flight plan, or at night, and is continued beyond the published range of normal airways navigation facilities (VOR/DME, NDB) is considered to be a long range navigation operation. Long-range navigation in controlled airspace (CTA) requires the aircraft to be navigated within the degree of accuracy required for air traffic control (ATC), meaning the aircraft must make every effort to follow the centerline of the assigned route, the assigned altitude, as well as the speed filed or assigned. Accurate navigational performance is required to support the separation minima ATC units apply. To sustain or refine the separation minima, adherence to the cleared route must be demonstrated. The best available measurement of such adherence is obtained by radar observation of each aircraft's proximity to centerline prior to its coming into coverage of short range navigation aids at the end of the oceanic navigated portion of the flight. If an observation indicates that an aircraft was not reasonably within the airspace normally protected, the reasons for apparent deviation from centerline must be determined and steps taken to prevent recurrence and to improve overall navigation performance.

When radar is available to monitor organized oceanic route systems, Oceanic Navigational Error Reports (ONER) will be recorded on observed lateral deviations of 20NM or more, which will be investigated to determine causal factors. Pilots should understand that these reports are intended to provide data for analytically detecting any significant changes in navigational environment which may require corrective action.

The above-mentioned separation standards can be found in the International Civil Aviation Organization (ICAO) Regional Supplementary Procedures Document 7030. For flight conducted in international airspace under the jurisdiction of the United States, Air Traffic Control Handbook Chapter 8 (FAA Order 7110.65) provides a simplified version of these separation minima.

Federal Aviation Regulation (FAR) 91.703 requires that civil aircraft must comply with ICAO Annex 2 when operating over the high seas. Annex 2 states that "Aircraft shall be equipped with suitable instruments and with navigation equipment appropriate to the route being flown." In addition, ICAO Annex 6, Part II, stipulates that an aircraft operated in international airspace be provided with the navigation equipment which will enable it to proceed in accordance with its operational flight plan; with prescribed RNP types; and with the requirements of air traffic services. This means that the navigation equipment, installed and approved, should be capable of providing the pilot with the ability to navigate the aircraft with the required accuracy.

Annex 2 further requires that an aircraft adhere to the current flight plan unless a request for a change has been made and clearance obtained from the appropriate ATC facility. Annex 2 also mandates that unless otherwise authorized and directed

by the appropriate ATC unit, controlled flights shall, insofar as practicable: a) when on an established ATS route, operate along the centerline of that route, or b) when on any other route, operate directly between the navigation facilities and/or points defining that route.

All of the aforementioned requirements contained in Annex 2 (as supplemented by Regional Supplementary Procedures Document 7030 and Annex 6) are incorporated in Section 91.1 and 91.703 of the FARs for those aircraft operating under United States civil certification in international oceanic airspace.

The FAA's William J. Hughes Technical Center, ACT-520, maintains a database of RNP-10 approved aircraft (regardless of State of Registry). Whenever an operator obtains or loses an RNP-10 approval, the operator should advise ACT-520 indicating:

1. State of registry of the aircraft, expressed, if possible, as the appropriate 2-letter identifier given in ICAO DOC 7910/71.
2. Name of the operator, expressed, if possible, as the appropriate 3-letter identifier given in ICAO DOC 8585/87.
3. State of the operator, expressed, if possible, as a designator from ICAO DOC 7910/71.
4. Aircraft type, expressed, if possible, as a designator from ICAO DOC 8643/21.
5. Aircraft mark or series.
6. The aircraft manufacturer's serial number or construction number.
7. Aircraft's registration number.
8. Make/model of long range navigation systems and number with which equipped (e.g., 3 Carousel IV INS's).
9. For INS or IRU's: approved RNP-10 time limit (e.g., 6.2 hours, 10.0 hours).
10. Aircraft's 24-bit mode S address (if applicable).
11. Name of the authority that issued or revoked the aircraft's RNP-10 approval.
12. The date of approval or revocation.
13. Document used for criteria to approve or revoke RNP-10 (e.g., FAA Order 8400.12A). If the document allows more than one method of approval, the operator should cite the method used (e.g., AFM Revision, data collection) and reference document chapter number or paragraph number.
14. Any other relevant remarks.

The above information should be submitted to the following:

William J. Hughes Technical Center, ACT-520
Federal Aviation Administration
Atlantic City Airport, NJ 08405, USA
Attn.: RNP-10 Approval

NAVIGATION PROCEDURES

I. Use of Non-Directional Beacon (NDB) For Navigation

The use of an NDB as the "primary" source of navigation for long range oceanic flight presents the operator with numerous limitations and restrictions that are inherent in low frequency radio equipment and the low frequency signals they receive. These include:

- A. NDB navigation aids of the highest power (2000 or more watts) which are maintained and flight-checked as suitable for air navigation are limited in their usable service and/or reception range to no more than 75 nautical miles from the facility at any altitude.
- B. Although the operator may be able to receive standard (AM/amplitude modulation) broadcasts with NDB equipment, primary dependence on these facilities for navigation is discouraged because of the inherent problems associated with these stations.

II. The Use of a Master Document

The navigational procedures must include the establishment of some form of master working document to be used on the flight deck. This document may be based upon the flight plan, navigation log, or other suitable document which lists sequentially the waypoints defining the routes and distances between each waypoint, and other information relevant to navigation along the cleared route. When mentioned subsequently in this section, this document will be referred to as the "master document".

Misuse of the master document can result in gross navigation errors being made and for this reason strict procedures regarding its use should be established. These procedures should include the following:

- A. Only one copy of the master document should be used in the cockpit. (If more than one copy is provided, one may be altered to reflect reclearance and/or other relevant amendments but the other may not. Subsequently, the unaltered copy may be used to extract navigational data which results in an unintentional deviation from the current cleared route.)
- B. A waypoint numbering sequence should be established from the outset of the flight and entered on the master document. The identical numbering sequence should be used in storing waypoints in the navigation computer(s).
- C. An appropriate symbology should be adopted to indicate the status of each waypoint listed on the master document. Following is a typical example routing:
 1. The waypoint number is entered against the relevant waypoint coordinates to indicate that the waypoint has been inserted in the navigation computer(s);
 2. The waypoint number is circled to signify that insertion of the correct coordinates in the navigation computer(s) has been double-checked independently by another crew member;
 3. The circled waypoint number is ticked to signify that the relevant route distance information has been double-checked; and,
 4. The circled waypoint number is crossed out to signify that the aircraft has overflown the waypoint concerned.

306 NOTICES

All navigational information appearing on the master document must be checked against the best available prime source data. If an ATS route change is received or the ATC clearance is otherwise updated, the master document must be updated accordingly. Old waypoints should be clearly crossed out and the updated ones entered in their place.

When ATC clearances or reclearances are being obtained, headsets should be worn, because the inferior clarity of loud speakers has been known to result in mistakes. Two qualified crew members should monitor such clearances, one of them recording the clearance on the master document as it is received, the other checking the receipt and read-back. All waypoint coordinates should be read back in detail (except where approved local procedures make this unnecessary under the circumstances that the cleared route coincides with the filed ATS route, in which case each detail of this must be cross-checked with the master document).

III. Position Plotting

It is very helpful for crews to use a simple plotting chart to provide themselves with a visual presentation of the intended route. Merely plotting the intended route on such a chart may reveal errors and discrepancies in the navigational coordinates which can then be corrected immediately, before they reveal themselves in terms of a deviation from the ATC-cleared route. As the flight progresses, plotting the aircraft's position on this chart approximately 10 minutes after passing each waypoint will also serve the purpose of navigation cross-check, provided that the graticule is legible.

As the flight progresses in oceanic airspace, plotting the aircraft's position on this chart will help confirm (when it falls precisely on the route) that the flight is proceeding in accordance with its clearance. But if the plotted position is laterally offset, the flight may be deviating unintentionally and this possibility should be investigated at once.

IV. Relief Crew Members

Flight crews conducting very long range operations may include an extra relief pilot. In such cases, it is necessary to ensure that the navigational procedures are such that the continuity of the operation is not interrupted, particularly in respect of the handling and treatment of the navigational information.

V. System Alignment

The alignment of INS must be completed and the equipment switched to the NAV mode prior to releasing the parking brake at the ramp for push back. This takes approximately 15 minutes, but can be longer. There are various ways of ensuring that there is adequate time for this including, for example, the following:

- A. Have the first crew member on the flight deck (often the crew member responsible for aircraft fueling) place the system(s) in the align mode as soon as practicable;
- B. At short transit stops, leave the equipment in NAV provided that system (radial) errors are not so large as to require INS realignment. The decision to realign may depend on the size of the error as well as the length and nature of the next leg;
- C. Note that INS batteries usually have a limited life (15 minutes in typical cases) and cannot be recharged on board if allowed to run down. If the INS is left in NAV during a transit stop, or if the INS has been switched on for alignment, it is imperative that an individual be responsible for monitoring ground power interruptions. Note also that some INS provide overheat protection in STBY and ALIGN but not in other modes, so that during transits at tropical terminals with this equipment, the mode selector should be put directly (i.e., not through STBY because that would initiate realignment) to ALIGN.

VI. Initial Insertion of Latitude and Longitude

Early in the course of the preflight checking procedures, the aircraft's present position (POS) should be loaded into the INS. This position must be checked against an authoritative reference source before insertion. Any latitude error in the initial position will introduce a systematic error into the calculations and cannot be removed in flight by updating the resulting erroneous indications of POS. Correct insertion of POS must therefore be checked before the ALIGN mode is selected and the inserted POS recorded in the Flight Log or master document. Subsequently, silent checks of POS should be carried out independently by both pilots during an early stage of their preflight checks.

With regard to the insertion (while on the ramp) of the initial coordinates, the following points should be taken into account:

- A. In the case of some INS, insertion errors exceeding about one degree of latitude will illuminate a malfunction light. It should be noted that very few systems provide similar protection against longitude insertion errors;
- B. At all times, but particularly in the vicinity of 180° longitude, care should be taken to ensure that the coordinates previously inserted are correct.

VII. Loading of Initial Waypoints

The entry of waypoint data into the navigation systems must be a coordinated operation by two persons working in sequence and independently. One should key in and insert the data and subsequently, the other should recall it and confirm it against source information. It is not sufficient for one crew member just to observe another crew member inserting the data.

Waypoint 1 should be used for the ramp position of the aircraft. At least two additional waypoints, and if possible all the waypoints relevant to the flight, should be loaded while the aircraft is at the ramp. It is, however, most important to ensure that the second waypoint is inserted accurately, rather than to endeavor to load the maximum number of waypoints. In this regard, the second waypoint should be associated with the first significant position along the route (approximately 100NM from the departure point) and positions associated with ATC SID's should not normally be used for this purpose.

During flight, at least two current waypoints beyond the sector being navigated should be maintained in the CDU until the destination ramp coordinates are loaded. The two pilots should be responsible for loading, recalling, and checking the accuracy of the inserted waypoints, one loading and the other recalling and checking them independently. Where remote loading of the units is possible, this permits one pilot to cross-check, additionally, that the data inserted by the other is accurate. In neither case, however, should this process be permitted to engage the attention of both pilots simultaneously during the flight. An alternative and acceptable procedure is for the two pilots silently and independently to load their own

initial waypoints and then cross-check them. The pilot responsible for carrying out the document rather than in the opposite direction. This may lessen the risk of his "seeing what he expects to see", rather than what is actually displayed. After the initial waypoints have been loaded, the initial route (between waypoints 1 and 2) and AUTO track change should be selected.

VIII. Flight Plan Check

The purpose of this check is to ensure complete compatibility between the master document and the programming of the self-contained navigation systems.

- A. DIS/TIME should be selected to check that the correct distance from the ramp position to waypoint 2 is indicated. An appropriate allowance may have to be considered at this point since the great circle distance shown on the CDU's may be less than the flight plan as a consequence of the additional mileage involved in ATC SID's. However, if there is significant disagreement, POS and waypoint 2 coordinates should be rechecked.
- B. Select REMOTE and track change 1-2 and check the accuracy of the indicated distance against that listed in the master document.
- C. Select DSRTK and check that the desired track indicated on the CDU is as listed in the master document. This track check will reveal any errors made in the latitude or longitude designators, i.e., north/south or east/west, of the aircraft's ramp position.
- D. Similar track and distance checks should be carried out for subsequent pairs of waypoints and any discrepancies between the master document and the CDU indications checked for possible waypoint insertion errors. These checks can be coordinated between the two pilots against the information in the master document.
- E. When each leg of the flight has been checked in this manner, it should be annotated on the master document by means of a suitable symbology as previously suggested.

IX. Leaving the Ramp

If the aircraft is moved prior to the NAV mode being initiated, inertial navigation systems must be realigned. In this event, the aircraft should be relocated where it will not block the gate position or otherwise interfere with airport traffic while the realignment is being carried out. After leaving the ramp, INS groundspeeds should be checked, (a significantly erroneous reading may indicate a faulty or less reliable unit). A check should be made of the malfunction codes while the aircraft is stopped but after it has taxied at least part of the way to the takeoff position. Any significant groundspeed indication while stationary may indicate a faulty unit, such as a tilted platform.

X. In Flight

If the initial part of the flight is conducted along airways, the airways facilities should be used as the primary navigational aids and the aircraft navigation systems monitored in order to ascertain which system is giving the most accurate performance.

XI. Approaching the Ocean

Prior to entering the oceanic area, the aircraft's position should be checked as accurately as possible by means of external navigational aids in order to ascertain the preferred aircraft navigation system to be used for the ocean crossing. This may perhaps necessitate DME/DME, DME/VOR checks at which stage navigation system errors can be determined by comparison of displayed and actual position. There are other means of carrying out such a check, e.g., flying directly over a VOR or NDB. In the event of a significant discrepancy, e.g., greater than 6NM, the question of whether or not the affected navigation system should be updated may be given cautious consideration. Updating is not normally recommended where the discrepancy is less than 6NM. If it is decided to update the system, the proper procedures should be carried out in accordance with a prepared checklist. The duration of the flight prior to the oceanic boundary and the accuracy of the external navigational facility should be taken into consideration when determining the advisability of updating the aircraft's navigation system. For example, an NDB would not be considered advisable for this purpose, unless care is taken to track directly overhead the facility.

The navigation system which has performed most accurately since departure should be selected for autocoupling.

In view of the importance of following the correct track in oceanic airspace, some operators advise that at this stage of flight the third pilot or equivalent crew member should check the clearance waypoints which have been inserted into the CDU, using appropriate source information.

XII. Oceanic Boundary Position Report

Just prior to the oceanic boundary and just before any waypoint, the present position coordinates should be monitored, recorded and verified, and the coordinates for the next waypoint monitored and verified. Thus, when the CDU alert light comes on, the crew should proceed to note and record the aircraft's present position on the master document. This should be verified against the current effective clearance on the master document. The waypoint number on the master document should be annotated with the appropriate symbol to indicate that it has been verified.

If the oceanic boundary position report is made over a VOR facility, the appropriate radial to the first oceanic waypoint should be selected as a further check that the aircraft navigation system is tracking in accordance with the current effective clearance. If DME is also available, a distance check can be carried out as well.

XIII. At an Oceanic Waypoint

Coordinates of the next two waypoints should be verified against the master document, as suggested earlier. When sending the ATC position report, the coordinates should be copied from the master document or, alternatively, the present position and the next two forward positions can be read from the CDU. As soon as the waypoint alert light illuminates, the present position coordinates of each navigation system should be checked against the current clearance to ensure that the intended aircraft position report to ATC coincides with the actual position of the aircraft and the ATC clearance. Overhead the waypoint, the pilots should observe that the aircraft turns in the correct direction and takes up a new heading appropriate to the leg to the next waypoint. The coordinates of the next waypoint should be verified against the master document as previously described. After the ATC position report has been sent, the present position of the aircraft should

be plotted on the pilot chart to ensure that it is tracking as intended. At this stage also, the crew should be particularly alert in maintaining SELCAL watch, in view of possible ATC follow-up of the position report.

XIV. Routine Monitoring

It is important to remember that there are a number of ways in which the autopilot may unobtrusively become disconnected from the command mode; therefore, regular checks of correct engagement should be made. Although it is common practice to display DIS/TIME, it is recommended that the navigation system coupled to the autopilot should display the present position coordinates throughout the flight. If these are then plotted on the pilot chart at approximately 20-minute intervals, they will provide confirmation at regular intervals that the aircraft is tracking in accordance with its ATC clearance. Distance-to-go information should be available on the instrument panel as previously mentioned, while the waypoint alert light provides a reminder of the imminence of the waypoint. If as an alternative, position check and verification is being made both at each waypoint and 10 minutes after each waypoint, then an additional plot 20 minutes later may perhaps to be considered counter-productive as a normal routine. Even so there may be circumstances, e.g., when the flight is down to one system only, justifying the procedure. The navigation system not being used to steer the aircraft should display cross track distance (XTK) and track angle error (TKE). These should be monitored with XTK being displayed on the HSI where feasible.

Where there is a discrepancy between the information provided by two navigation systems, the procedures detailed in paragraph XXIV. below should be applied.

XV. Use of Radar

Aircraft equipped with airborne weather radar capable of ground mapping should use it to observe any land masses as an aid in assessing the accuracy of their navigation.

NOTE: Aircraft conducting NOPAC operations under U.S. civil certification are required to be equipped with functioning weather radar approved for day and night operation and their flight crews must use it on a full time basis for monitoring navigation system accuracy.

XVI. Approaching Landfall

When the aircraft is approaching the first landfall naavid, it should acquire the appropriate inbound radial as soon as the flight crew is confident that the landfall naavid is providing reliable navigation information. The aircraft should then be flown to track, by means of radio navigation, overhead the facility, which thus becomes the primary navigational guidance after leaving the oceanic area, e.g., for direct clearance over land. Consideration should be given to updating the navigation system overhead the landfall fix, utilizing the appropriate procedures from the checklist.

XVII. Navigation System Accuracy Check

At the end of each flight, an evaluation of accuracy of the aircraft's navigation systems should be carried out in order to facilitate correction of out-of-tolerance performance. One such accuracy check, carried out when the aircraft has reached its parking position, is to remove any update s which may have been made during the flight and then determine the radial error at the ramp position. Radial errors in excess of 2NM per hour are generally considered excessive.

Records should be kept of aircraft navigation systems performance.

XVIII. Monitoring During Distractions from Routine

Training and drills should ensure that minor emergencies or interruptions to normal routine are not allowed to distract the crew to the extent that the navigation system is mishandled. If during flight the autopilot is disconnected (because of turbulence, e.g.), care must be taken when it is reengaged to ensure that the correct procedure is followed (if the system in use sets a specific value on the boundary of automatic capture, the across-track indications should be monitored to ensure recapture of the programmed flight path). It is important to remember that there are a number of ways in which the autopilot may unobtrusively become disconnected from the command mode.

XIX. Avoiding Confusion Between Magnetic and True

To cover all navigation requirements, some airlines now produce flight plans giving both magnetic and/or true tracks (courses). If crews are changing to a new system, however, there is a risk that at some stage (e.g., partial system failure, reclearances, etc.), confusion may arise in selecting the correct values. Operators should therefore devise drills which will reduce this risk, as well as ensuring that the subject is covered during training.

Crews who decide to check or update their long range navigation systems by reference to VOR's located in the Canadian Northern Control Area should remember that they are not aligned with reference to magnetic north.

XX. Navigation in the Area of Compass Unreliability

NOTE: Full coverage of this subject, including, for example, the possible provision of runway headings in grid is beyond the scope of this section. The following should therefore be considered as general guidance only.

In an area of compass unreliability, basic INS operation requires no special procedures, but most operators feel it is desirable to retain an independent heading reference in case INS failure occurs. There are various possible ways of doing this, dependent on the instrument fit.

XXI. Deliberate Deviation from Route

Deliberate temporary deviations from route centerline are sometimes necessary, usually to avoid severe weather, but prior ATC approval should be obtained. Such deviations have often been the source of gross errors as a consequence of failing to reengage the autopilot with the navigation system. It should also be noted that selection of the "turbulence" mode of the autopilot will also have the effect of disengaging it from the aircraft navigation system. After use of the turbulence mode, therefore, the aircraft must be flown back to the desired route before reengaging the autopilot with the navigation system.

The following procedures have been found effective in ensuring that gross navigational errors do not result from diversions around severe weather:

- A. The autopilot turn control knob is used to turn the aircraft in the desired direction;
- B. The "autopilot engage" switch will automatically move from "command" to "manual". (The altitude mode switch will either remain in "altitude hold" or if in the "altitude select" mode will trip to "off".);
- C. The steering CDU data selector is set to XTK TKE in order to provide a continuous display of crosstrack data;
- D. If turbulence is encountered, the "TURB" setting on the speed mode selector may be used in which case the altitude mode switch will automatically position to "off";
- E. Both RADIO INS switches remain in the INS position. This provides another visual display of the navigation situation on the HSI. Even when more than 8NM off track the pegged needle on the HSI is a reminder of that fact, in addition to which it will confirm whether the aircraft is tracking towards, away from, or parallel to the desired track;
- F. The turn control knob should be used to maneuver the aircraft as necessary;
- G. When clear of the severe weather, the aircraft should be steered back to the desired track, guidance being obtained from the steering CDU to zero the XTK indication;
- H. When the aircraft has been returned to the desired route, the autopilot engage switch is selected to "command" and the altitude mode switch to "altitude hold". (The navigation mode selector should still be in the INS position.);
- I. It is desirable that the entire crew, but at least the Captain and First Officer, monitor the diversion maneuver to ensure that the aircraft has been returned to the desired route and the autopilot properly reengaged for command INS operation; and
- J. After return to route has been completed, check assigned MACH number and advise ATC.

XXII. ATC Reclearance

Experience suggests that when ATC issues a reclearance involving rerouting and new waypoints, there is an increase in the risk of errors being made. This situation should, therefore, be treated virtually as the start of a new flight, and the procedures employed with respect of copying the ATC reclearance, amending the master document, loading and checking waypoints, extracting and verifying flight plan information, routes and distances, etc., and the preparation of a new plotting chart should be identical to the procedures employed at the beginning of a flight. When an in-flight reclearance is involved, however, the procedures should be sure that one pilot is designated at all times to be responsible for flying the aircraft while the reprogramming of all navigation systems and other amendments to the cockpit documentation are being carried out.

In the event that the reclearance involves a direct routing, it may be advisable to retain data relevant to the original route.

XXIII. Detection of Failures

INS installations normally include comparator and/or warning devices, but it is still necessary for the crew to make frequent comparison checks. With three systems on board, the identification of a defective system should be straightforward.

With only two systems on board, experience indicates that if nothing is done by the crew until significant divergent indications become apparent, the possibility of identifying the defective unit will be very much reduced. If such a situation does in fact arise in oceanic airspace, it may be possible to contact nearby aircraft on 123.45 MHz (see Section 3, paragraph IV.B.) and obtain the read-out of spot wind (or if the aircraft are going in the same direction, drift and ground speed) making use of this information to identify the defective system.

In many cases, however, the above may be impractical. For that reason, it is recommended that a regular record of INS performance should be maintained and kept available on board for operating crews, in line with the following suggestions:

- A. Before takeoff and while stationary, note the INS ground speed and POS indications. These may give some indication of relative system accuracy;
- B. The accuracy of each INS unit should be noted before reaching oceanic airspace, preferably when passing some convenient short range facility. A further record should be made at destination in terms of terminal error, first taking care to cancel any inflight update which may have been made;
- C. Compass deviation checks can be made to obtain deviation values for the magnetic compass systems, so that, if necessary later in the flight, the relative accuracy of INS heading outputs (and navigation data) can be checked. Though slightly complex to write up, the method is simple and potentially valuable in practice, and it has the additional advantage of reminding crews of some basic elements of navigation. Prior to entering oceanic airspace, simultaneously read both INS true heading and both magnetic compass indications. To the mean of the INS readings, apply the local variation value to give magnetic heading. Compare this value with the magnetic heading compass readings to obtain the deviation on each and retain for possible use in the "heading method" of determining which system is faulty (paragraph XXIV.E.).

XXIV. Determining the Faulty System

- A. Check malfunction codes for indications of unserviceability.
- B. Refer to the records suggested under subparagraphs XXIII.A. and B., above. These give a fairly positive clue as to which system is faulty.
- C. Obtain a fix. It may be possible to use the weather radar (range marks and relative bearing lines) to determine the position relative to an identifiable landmark such as an island or the ADF to obtain bearings from a suitable NDB, in which case the variation at the position of the aircraft should be used to convert the RMI bearings to true; or if within range, the VOR, in which case the variation of the VOR location should be used to convert the radial to true heading (except when flying in the Canadian Northern Control area). (See paragraph XIX.)
- D. Call some nearby aircraft on air-to-air VHF, and compare information on spot wind, or ground speed and drift. If such assistance is not available, the wind speed and direction for the DR position of the aircraft may be extracted from the prognostic chart for comparison with the readout of INS. It is emphasized, however, that the latter comparison should only be used as a last resort and preferably in conjunction with another method to confirm the result.
- E. Use the heading method. Simultaneously read both INS and both magnetic compass indications. Apply the respective deviation and the local variation value to each compass reading and obtain the mean (to the nearest

degree). This should give an acceptably accurate true heading value to compare with the INS readings and to establish whether one of the INS units is defective. The following format, with typical values inserted, may assist flight crews with limited navigation experience:

Before Entering Oceanic Airspace				
	#1 INS	#2 INS	#1 Comp	#2 Comp
Heading	285.7°	286.1°	290°	293°
Mean True				
Heading				
(nearest degree)		286°		
(E-)				
Variation				
(W+)		6°W		
		292°	Dev'n 2°	1°W
If INS performance check required later in flight				
	#1 INS	#2 INS	#1 Comp	#2 Comp
Heading	254°	259°	265°	266°
(E+)				
Deviation				
(W-)			2°E	1°W
			267°&65	265°
(E+)				
Variation				
(W-)			12°W	12°W
Mean TH			255°	253°
			254°	

The above indicates that the navigation information provided by #1 INS is likely to be more accurate.

XXV. What to do if the Faulty System Cannot be Identified

Despite application of the methods in paragraph XXIV. above, the occasion may still arise when distance or across track differences develop between two INS systems, but the crew cannot determine which system is at fault. The majority of airlines feel that the procedure most likely to limit gross tracking errors under such circumstances is to fly the aircraft halfway between the cross track differences as long as uncertainty exists. In such instances, ATC must be advised that the flight is experiencing navigation difficulties so that appropriate clearance(s) can be issued as necessary.

XXVI. Guidance on what Constitutes a Failed System

Crews also require guidelines on how to decide when an INS should be considered to have failed, e.g., failure of INS may be indicated by the red warning light, or by self-diagnosis indications, or by an error over a known position exceeding the value agreed between an operator and its certifying authority. In general, if there is a difference greater than 15NM between the two aircraft's navigation systems (or between the three systems if it is possible to detect which are the more reliable) it is advisable to split the difference between the readings when determining the aircraft's position. If, however, the disparity exceeds 20NM, one or more of the navigation systems should be regarded as having failed, in which case ATC must be notified.

XXVII. Partial or Complete Loss of Navigation Capability

There are two navigational requirements for aircraft planning to fly through NOPAC oceanic airspace. One refers to the navigation performance which should be achieved and the other to the need to carry standby equipment with comparable performance characteristics (as stipulated in ICAO Annex 6, Part 1, Chapter 7).

Some aircraft carry triplex equipment (e.g., 3 INS) and if one system fails even before takeoff, the two basic requirements may still be satisfied and the flight can proceed normally. For aircraft with only two operational systems the following guidance is offered in respect of these general areas of failure:

- A. If one system fails before takeoff, the pilot should consider delaying departure if timely repair is possible or obtaining a clearance below FL280, if practicable.
- B. If one system fails before the oceanic boundary is reached, the pilot will have to consider landing at a suitable airport before the boundary, returning to the airport of departure, or obtaining a reclearance below FL280.
- C. If one system fails after the aircraft has entered oceanic airspace, the pilot should normally continue to operate the aircraft in accordance with the oceanic clearance already received, appreciating that the reliability of the total navigation system has been significantly reduced. The pilot should also, however, take the following action:
 1. Assess the prevailing circumstances (e.g., performance of the second system);
 2. Prepare a proposal to ATC with respect to the prevailing circumstances (e.g., request clearance below FL280, turnback);
 3. Consult with ATC as to the most suitable action; and
 4. Obtain appropriate ATC reclearance prior to any deviation from existing clearance.
- D. When, after entering oceanic airspace and one system has failed, the flight continues in accordance with its original clearance (especially if the distance ahead within oceanic airspace is considerable), the pilot should begin a special monitoring program as follows:
 1. Take special care on the operation of the remaining system, accounting for the fact that the routine method of error checking is no longer available.
 2. Check the main and standby compass system against the information available.

3. Check the performance record of the remaining equipment and, if doubt arises regarding the performance and/or reliability, consider the following:
 - a. Attempt visual sighting of other aircraft or their contrails which may provide a track indication;
 - b. Call the appropriate ATC facility to obtain information on aircraft adjacent to the estimated position; and/or
 - c. Call on 123.45 (see Section 3, paragraph IV.B.) to establish contact with such aircraft (preferably same track/level) to obtain information which could be useful (drift, magnetic heading, wind details).
- E. If the remaining system fails after entering oceanic airspace, or the remaining system gives an indication of degradation of performance, or neither system fails completely but the system indications diverge widely and the defective system cannot be determined, the pilot should take the following action:
 1. Notify ATC;
 2. Make best use of procedures specified in XXVII.D.3. above to obtain useful information;
 3. Keep a special look out for possible conflicting aircraft and make maximum possible use of outside lights; and
 4. If no instructions are received from ATC within a reasonable period, consider use of contingency procedures in Section 6.

NAVIGATION ERRORS

Monitoring procedures employed in regard to traffic operating in oceanic areas have given a good indication of the frequency of occurrence and the causes of navigation errors. Errors actually occur very infrequently considering the thousands of flights that are made. Navigation systems are generally so reliable now that there is some concern that this may lead to overconfidence. Aircrews, therefore, must guard against complacency.

I. Common Causes of Errors

Following are some of the more common causes of gross errors:

- A. A mistake of one degree of latitude was made in inserting a forward waypoint.
- B. The INS system was not reprogrammed after reclearance by ATC.
- C. The autopilot was inadvertently left in the heading OR decoupled position after avoiding clouds or left in the VOR position after leaving the last domestic airspace VOR. In some cases, the mistake arose during distraction caused by SELCAL or by some flight deck warning indication.
- D. The controller and the crew had different understandings of the clearance. The pilot read back not what was said, but what he wanted to hear, and the controller failed to catch the discrepancy.

II. Rare Causes of Errors

Following are examples of some rare faults which have actually occurred:

- A. The lat/long coordinates displayed near the gate position at one international airport were wrong.
- B. Because of a defective chip in one of the INS systems on an aircraft, although the correct forward latitude was inserted by the crew, it subsequently "jumped" by one degree.
- C. The aircraft was equipped with an advanced system with all the coordinates of the waypoints on the intended route already on tape; the crew assumed that these coordinates were correct, but one was not.
- D. The flight crew had available to them the correct coordinates for their cleared route, but unfortunately the data which they inserted into the navigation computer was from the company flight plan, in which an error had been made.

III. Lessons to be Learned

- A. Never relax or be casual regarding the cross-check procedure, this is especially important towards the end of a long night flight.
- B. Avoid casual radiotelephony procedures. Errors have resulted from a misunderstanding between pilot and controller as to the cleared route. Adhere strictly to proper phraseology and do not be tempted to clip or abbreviate details of waypoint coordinates.
- C. Make an independent check on the gate position. Do not assume that the gate coordinates are correct without cross-checking with an authoritative source. Normally, coordinates are to the nearest tenth of a minute, but make sure that your display is not to the nearest hundredth, or in minutes and seconds. And, if you are near 180° longitude, remember the risk of confusing east and west.
- D. Before entering oceanic airspace make a careful check the INS System position at or near to the last radio facility or the next to last one.
- E. Do not assume that you are at a waypoint merely because the alert annunciator indicates it. Cross-check by reading present position.
- F. Flight deck drills. Some tasks on a flight deck can safely be delegated to one member of the crew, but navigation, using automated systems, is emphatically not one of them. The Captain should participate in all navigation cross-check procedures.
- G. Initialization errors. Always return to the ramp and reinitialize INS if the aircraft is moved before the INS NAV mode is selected. If, after getting airborne, it is found that during initialization a longitude insertion error has been made, unless you thoroughly understand drills on how to achieve the objective, you should probably turn back or make an en route stop if practicable.
- H. Waypoint loading. Before departure, check to see that the computer flight plan and ICAO flight plan agree. In flight, involve two different sources in the cross-checking if possible. Do not be so hurried in loading waypoints that mistakes become likely and always check waypoints against the current ATC clearance.
- I. Use a Pilot-Chart on the flight deck. Make periodic plots of position on a suitable chart and compare with current cleared track. This helps to pick up errors before getting too far from track.

- J. Consider making a simple use of basic DR Navigation as a backup. Outside Polar Regions, provided that the magnetic course (track) is available on the flight log, a check against the magnetic heading being flown, plus or minus drift, will likely indicate any gross tracking error.
- K. Always remember that something unusual may have happened in the last half-hour. Be continuously cognizant. There are often ways in which an overall awareness of directional progress can be maintained; e.g., the position of the sun or stars, disposition of contrails, islands or coastlines which can be seen directly or by using radar, radio nav aids, and so forth. This is obvious, perhaps, but some of the errors which have occurred could have been prevented had the crew shown more of this kind of alertness.
- L. If you suspect that equipment failure may be leading to divergence from cleared route, it is better to advise ATC early rather than late.
- M. Because aircraft navigational equipment varies greatly between operators, some of the above lessons may not apply in your case. But remember that they may help to prevent someone else making a mistake, and may stimulate you to avoid mistakes of similar nature.

PILOT CHECKLIST

To assist pilots who are less familiar with the NOPAC Route System, the following informal checklist is provided:

1. Do you have the recommended information for each NOPAC route?
2. Do you have a reliable timepiece aboard for reference and have you had a recent accurate time check?
3. Are you sure of the serviceability of your long range navigational system?
4. Are you familiar with the MACH number technique?
5. Did you conduct a check of your airborne weather radar, if so equipped?
6. Have you preplanned your actions in case one of your long-range navigational systems fails?
7. After departure, did you conduct an HF communications check and pass your departure time to aeronautical radio?
8. Did you give ATC your climb times?
9. If eastbound between 145E and 170E, or westbound between 164E and 145E, did you set your transponder on Mode A Code 2000? If east of 170E or west of 145E, is your transponder set on the discrete code assigned by ATC?

ANCHORAGE ARCTIC FIR

I. DESCRIPTION

The Anchorage Arctic FIR generally consists of that airspace lying between 141° west longitude and 168° 58.38' west longitude south of the geographic North Pole running approximately to 72° north latitude. The material which follows also incorporates that portion of the Anchorage Domestic FIR which overlies the north coast of the Alaskan land mass.

Traffic flows in this airspace consist of: 1. a generally east/west flow for flights transiting between North American and Asian airports via the Russian Polar airspace (commonly referred to as "Cross Polar" flights) and, 2. an east/west flow of flights transiting between northern European and Alaskan airports (commonly referred to as "Trans Polar" flights).

II. SEPARATION STANDARDS

VERTICAL – Reduced Vertical Separation Minima (RVSM) is applied from FL290 to FL410 inclusive in all of the Anchorage FIRs, i.e. Anchorage Domestic, Oceanic and Arctic Flight Information Regions. RVSM aircraft are separated by 1000 foot vertical spacing within this stratum. Non-RVSM aircraft are separated from *all* other aircraft, both RVSM and Non-RVSM, by 2000 feet within this stratum.

Aircraft within the Edmonton FIR are also separated via RVSM procedures and minima. Aircraft in the Magadan and Murmansk FIRs are separated by 500 vertical meters at and below 12,100 meters, and by 1000 vertical meters above 12,100 meters.

LATERAL – Anchorage ARTCC is authorized to utilize a 90 nautical mile (45 miles either side of centerline) separation standard between tracks.

In the adjoining FIRs, Edmonton utilizes a 60 nautical (30 nautical miles either side of centerline) separation standard based on Canadian Minimum Navigation Performance Standards (CMNPS) and Magadan/Murmansk ACC's utilize a 60 kilometer lateral separation standard.

LONGITUDINAL – Within the Anchorage Arctic FIR the longitudinal separation standard between turbo jet aircraft is 15 minutes. This minima may be reduced thru application of the ICAO recognized MACH Number Technique.

In the adjoining the FIRs, both Canadian and Russian, the 15 minute standard is used and is reducible to 10 minutes thru application of MACH Number Technique.

III. FLIGHT PLANS and PREFERRED ROUTES

A. Cross Polar

1. All aircraft shall flight plan and report a position crossing 141° west longitude.
2. Operators flight planning ORVIT (7900.0N 16858.4W), regardless of direction of flight, shall flight plan a point along 141° west longitude over or south of OMEKA (7810.6N 14100.0W).
3. Operators flight planning NIKIN (8049.6N 16858.4W), regardless of direction of flight, shall flight plan a point along 141° west longitude over or north of COALL (8000.0N 14100.0W).

B. Trans Polar

1. Operators shall flight plan via ATS tracks M450, M451, or M452 within the Anchorage FIRs.
2. Flights filing between FYU and 141° west longitude shall flight plan via ADREW J160 or POTAT J167.

3. Preferred routes connecting with the PANC terminal area are as follows:

Northbound:

M450: ANC J115 FAI direct KARLL
 M451: ANC J115 FAI direct ARBEZ
 M452: ANC J115 FAI direct HARVZ
 M453: ANC J115 FAI J120 FYU J160 ADREW
 M454: ANC J115 FAI J120 FYU J167 POTAT

Southbound:

M450: KARLL direct TKA J125 ANC
 M451: ARBEZ direct ENN J125 ANC
 M452: HARVZ direct ENN J125 ANC
 M453: ADREW J160 FYU J120 FAI direct ENN J125 ANC
 M454: POTAT J167 FYU J120 FAI direct ENN J125 ANC

IV. COMMUNICATIONS and REPORTING

A. CPDLC – Controller/Pilot Data Link Communications service is operational in that portion of the Anchorage Arctic Flight Information Region south of 84° north latitude. Anchorage ARTCC's logon address for this airspace is PAZA. Currently aircraft entering the Anchorage Arctic FIR from Canadian or Russian airspace must perform a manual logon. Aircraft logged on to Anchorage's system and transitioning either to the Edmonton, or to the Magadan, CPDLC systems will be provided auto address forwarding service. Due to the high latitude and satellite coverage "foot print," flight crews of CPDLC equipped aircraft are requested to logon on via CPDLC but must also maintain a listening watch on appropriate HF frequencies.

B. HF VOICE – High Frequency Voice Communications capability exists within the Anchorage Arctic FIR via GANDER RADIO, MAGADAN CONTROL, and SAN FRANCISCO ARINC. Utilize these services as follows:

1. "GANDER RADIO" on frequencies of the North Atlantic NAT D network, viz. 2971, 4675, 8891, and 11279 KHZ. Position reports along 141° west longitude in the Arctic FIR should be routinely made thru GANDER RADIO. GANDER RADIO will also relay aircraft requests to Anchorage ARTCC while the aircraft are within Anchorage FIRs.
2. "MAGADAN CONTROL" on frequencies 4672, 5694, 8950 or 11390 KHZ. Position reports for **WESTBOUND** flights crossing 168° 58.4' west longitude shall be made to the appropriate Russian ACC via relay thru "MAGADAN CONTROL." **EASTBOUND** flights crossing 168° 58.4' west longitude shall relay their position reports thru GANDER RADIO.
3. "SAN FRANCISCO ARINC." Aeronautical Radio INC. maintains an HF transmitter/receiver at Barrow, Alaska. Used primarily for LDOC (long distance operational control) SFO ARINC's Barrow HF site does not provide routine ATC communications relays, but may be used when other methods fail. Frequencies monitored by the Barrow site are: 3013, 6640, 11342, 13348, 17925 and 21964 KHZ.

C. SATELLITE VOICE SYSTEM – Satellite Voice System (SATCOM Voice) equipment is available at Anchorage Center and SATCOM voice contact may be possible with aircraft in the Arctic FIR depending up satellite availability. Direct SATCOM Voice contact between the flight crew and Anchorage Center shall be limited to distress and urgency situations, or other exceptional circumstances only such as HF blackout. Under normal conditions routine communications should be conducted via VHF/CPDLC or HF Voice. Flight crews should log onto the INMARSAT Pacific Ocean Satellite. Aircraft satellite data units may be preprogrammed with the INMARSAT six digit code for easy call set-up. The INMARSAT code for Anchorage Center is 436602. If the aircraft provides direct dial access, the INMARSAT six digit code may be utilized for initiating air/ground communications. To receive SATCOM Voice service, the aircraft must already be logged onto an INMARSAT communication satellite. Direct SATCOM Voice calls to ATC should have one of the following ICAO priority levels:

1. Highest distress or urgent situations.
2. Second highest, flight safety situations.

RUSSIAN IFR ROUTES

I. General

The following information is provided as a planning aid for flights which will cross the Flight Information Region (FIR) boundary between the Anchorage and Russian FIRs (Murmansk, Magadan, Mys Schmidt, Anadyr or Petropavlovsk/Kamchatsky). **Procedures noted in bold are mandatory.** Failure to comply with these procedures may lead to delays, sub-optimal altitude assignment and/or denial of entry into the FIR. Flight Planners/Dispatchers must routinely refer to PAZA International NOTAMS for late breaking information which may extend or amend this notice.

Murmansk and Magadan FIRs contain oceanic airspace wherein oceanic Air Traffic Management (ATM) procedures are applied. Due to their latitude, routes crossing the Anchorage/Murmansk and Anchorage/Magadan FIR boundaries are referred to as "Cross Polar routes." Domestic procedures are utilized for flights crossing the other Anchorage/Russian FIR boundaries. These lower latitude routes are referred to as "Russian Trans East" (RTE) routes. Altitude assignments within Russia are denoted in *meters*. All aircraft transiting the Anchorage/Russian FIR boundary will therefore be required to transition between feet and meters. Routings thru Russian airspace are limited to published Air Traffic Service routes and available altitudes on these routes are also limited. Entry into Russian airspace requires prior coordination and approval. Flight Planners must refer to the Russian Aeronautical Information Publication (AIP) for complete information on airspace entry requirements.

In order to establish a safe, orderly and expeditious flow of air traffic across the Anchorage/Russian FIR boundary, Anchorage ARTCC (ZAN) has established a Track Advisory (TA) program. Electronic copies of the ZAN Track Advisory User's Guide are available upon request to Anchorage ARTCC International Procedures at (907)-269-1801. The TA program is designed to assist ATC in sequencing same altitude aircraft proceeding westbound over the Russian FIR entry fixes. In

314 NOTICES

order for the TA program to work efficiently, all parties must work cooperatively by complying with the Track Advisory procedures and by keeping the TA program updated with current/correct information.

II. Procedures:

A. All westbound operators flight planning to cross the Anchorage/Russian FIR boundary at or above FL280 (or above 8600 meters) shall participate in the ZAN TA program.

B. All Cross Polar Route and Russian Trans East users shall submit formatted TA requests (TKF messages) to ZAN via NADIN/AFTN (address PANC202D) or ARINC (address ANCDPXA) no later than 1430Z for flights crossing the Anchorage/Russian FIR boundary between 1700Z–0700Z or no later than 0430Z for flights crossing the Anchorage/Russian FIR boundary between 0700Z–1700Z. Participants without NADIN/AFTN or ARINC access may submit their TA request via fax (907) 269–1343 or via telephone to (907) 269–1104. A gateway reservation list (GRL) will be published according to the following table:

Trackload Program	File TKF	Compile and Send GRL	Negotiation Period	Archive Time
1700Z–0700Z	0900Z–1430Z	1430Z	1430Z–0000Z	0000Z
0700Z–1700Z	0000Z–0430Z	0430Z	0430Z–0900Z	0900Z

C. Flights filing Polar or RTE routes, not meeting their GRL window, (i.e. crossing time plus 10 minutes) may expect less than optimal altitude and/or reroute.

D. Available ATS routes and associated FIR boundary crossing fixes are: DEVID G490, DEVID B480, RAMEL G491, NIKIN G226, ORVIT G494, LISKI A218, FRENK B244 or G902, KUTAL B233, VALDA G212, and BESAT G583.

E. Useable altitudes, that is altitudes which may be filed in the ZAN TA program, for routes B233, G212, G226, and G902 are: 8600, 9600, 10600 and 11600 meters. Useable altitudes for routes A218 and B244 are: 9600, 10600 and 11600 meters. Useable altitudes for routes B480 and G490 are: FL310, FL350 and FL390. Useable altitudes for routes G226, G491 and G494 are: FL320, FL340 and FL380.

F. Aircraft filing a track slot request (TKF) thru the ZAN TA program for boundary crossing fix FRENK must denote the planned airway (B244 or G902) in the remarks section of the TKF. (See current PAZA international NOTAM for TKF filing instructions.)

G. Flights planning G583 shall use one of the following transitions to MARCC:

1. OME R338 MARCC G583.
2. ENM G583.
3. NEONN G349 MARCC G583.

H. Aircraft filing B244, G902, B233, G212, or G583 eastbound into the Anchorage FIR shall use one of the following transitions:

- A. B244/G902: Aircraft shall flight plan FRENK B244 OTZ.
- B. B233: Aircraft shall flight plan KUTAL direct GAL.
- C. G212: Aircraft shall flight plan VALDA direct MCG.
- D. G583: Aircraft shall flight plan MARCC G583 ENM or MARCC R338 OME.

III. User Participation Group:

The Federal Aviation Administration in partnership with the Federal Air Navigation Authority of Russia (FANA) has established an Air Traffic Service Provider/User group forum for the improvement of Air Traffic Management (ATM) on the Cross Polar and RTE routes. Operators' participation in this forum is highly desired. Contact Anchorage ARTCC International Procedures at (907)–269–1801 for meeting dates/locations.

RUSSIAN VFR ROUTE

Russian Air Traffic Service (ATS) Route B-369 Visual Flight Rules (VFR) for General Aviation aircraft.

A. Route Description. Waypoints are on chart; route width: 10 kilometers, altitudes: 1500-3000 meters. Route is available for operations 2100/0400 UTC Winter, 2000/0300 UTC Summer except Saturday and Sunday. Consult Russian VFR Enroute Chart YKD-11 and Russian Aeronautical Information Publication (AIP).

B. Advanced flight permission required. Request for single flight permissions of foreign civil aircraft on B-369 must be submitted in accordance with procedures contained in the Russian AIP. The request may be submitted in Russian or English and must be sent to both the International Relations Department of Civil Aviation and to the Central Department of Operational Services (CDOS) of Civil Aviation. The request must be submitted from 0900-1800 (Moscow time) except Saturdays, Sundays and Russian Federation public holidays. The submission must be on form "N" a minimum of 5 full working days in advance of intended flight. It is recommended that flight permission is requested at least 14 full working days in advance. B-369 begins at the U.S./Russian border and is ENTIRELY within Russian airspace. Pilots need to be familiar with and comply with all Russian Laws and Regulations while operating in Russian airspace including Customs, Immigration, and Agriculture, etc. A valid passport and Russian Visa is required. Consult the Russian AIP, or other commercial source, for pertinent aeronautical flight data. Aeronautical Flight Information for the Russian Federation is available from these known sources: 1) Russian AIP, which is published and distributed by the State Civil Aviation Authority of Russia, Center of Aeronautical Information of Civil Aviation. Contact: State Aviation Authority of Russia, State Unitary Enterprise, Centre of Aeronautical Information of Civil Aviation (SUE CAI CA) Svobody str. 67, Moscow, 123364; telephone: country code 7, (095) 492-3131; Fax: country code 7, (095) 948-5909; Email: caica@dol.ru. 2) The only known commercial source is published by Jeppesen, in their Airway Manual - Eastern Europe and Eurasia coverage. A trip kit can be ordered from Jeppesen, 1-800-799-9090. 3) Russian VFR En route Chart YKD-11, which covers the Chukotka area of Eastern Russia including Provideniya Bay Russia, can be obtained from the either the Alaska Airmen's Association (1-800-464-7030) or the printer, AO "AviaComInfo", 107078, Moscow, Bolshoy Kozlovsky st. 11/1, Russia; Telephone: country code 7, (095) 208-3304, Fax: country code 7, (095) 208-3403.

C. 4096 Code transponder required for operation on B-369. Each person operating an aircraft into or out of the United States on B-369 SHALL operate the transponder, including altitude encoding equipment if installed, and SHALL reply on the appropriate code or as assigned by Nome FSS. In addition, the aircraft SHALL comply with the transponder on requirements and ADIZ penetration procedures of 14 CFR part 99.

D. ICAO flight plan required. All aircraft intending to operate on B-369 to or from the U.S. must file an ICAO flight plan one (1) hour before intended departure. Aircraft departing the U.S. must file the ICAO flight plan with Nome FSS. The estimated border crossing time at BATNI and the CDOS flight permission number must be included in the Remarks section of the ICAO flight plan. Flight planned cruising levels for VFR flight on B-369 SHALL be in meters using QNH altimeter setting in accordance with Russian AIP.

E. Transportation Security Administration (TSA) waiver required. In accordance with Special Notice Operations to/from Locations Outside the U.S., issued as a domestic and international NOTAM, a waiver must be obtained from the U.S. TSA prior to operations on B-369 to or from the U.S. Waiver application must be submitted at least seven (7) days in advance. Application form and further information is available on the internet at <http://www.intl.faa.gov>. Then select: waiver process for flight operations.

F. Route Procedures - Aircraft departing the U.S. will be assigned a discrete transponder code by Nome FSS in accordance with DVFR procedures. Aircraft delayed more than 20 minutes from their flight plan departure time must notify Nome FSS of the delay. Once airborne, if estimated border crossing time at BATNI changes by more than 10 minutes, aircraft must notify Nome FSS of their new BATNI estimate. West bound aircraft from the U.S. must contact Lavrentiya Tower on freq 131.1 for permission to cross the Russian border and altitude assignment 10 minutes prior to their estimated time over BATNI. East bound aircraft bound for the U.S. SHALL request permission from Lavrentiya Tower, freq 131.1, to contact Nome FSS over KADAT with their estimated time over BATNI and request a discrete transponder code assignment for U.S. border crossing.

G. Additional information can be obtained from the Nome FSS 1-800-478-8400, the Alaskan Region Flight Standards division 907-271-5514, or at <http://www.alaska.faa.gov/at/russia.htm>. Pilots are reminded that they are expected to be familiar with all available information concerning the flight in accordance with 14 CFR 91.103. Pilots must familiarize themselves with all applicable aeronautical information and should contact Nome FSS for a complete briefing prior to conducting any flight operation on this route.

H. In addition, all aircraft failing to adhere to these procedures may be subject to interception. If capable, aircraft should maintain a listening watch on VHF Guard 121.5 or UHF 243.0. It incumbent on all aviators to know and understand their responsibilities if intercepted. Review the AIM, Chapter 5, section 6, paragraph 5-6-2 for Intercept Procedures.

BATNI

Wales

KILAK

Laurentiya

KADAT

East bound from Russia:

1. Request permission to change frequencies from Laurentiya tower then contact NOME FSS.
2. Contact NOME FSS over KADAT to report ETA over BATNI and receive discrete transponder code for ADIZ penetration.
3. Report BATNI to Laurentiya tower and NOME FSS.

West bound to Russia:

1. After departure, contact Nome FSS with your departure time and updated BATNI estimate.
2. If time over BATNI will vary more than 10 minutes from flight plan, inform NOME FSS, ASAP.
3. Contact "Laurentiya tower" on 131.1 for permission to cross border at least 10 minutes prior to your estimated time over BATNI. Laurentiya tower will issue altimeter setting and assign altitude in meters.
4. Report BATNI to Laurentiya tower. Cross BATNI at assigned altitude - flight level QNH.

AREA NOTICES

Landing at National Parks, Monuments, Preserves, and Wildlife Refuges

1. Prior authorization by the Superintendent is required for all helicopter landings. The National Park Service requests that pilots maintain a minimum distance of 2,000 feet from the nearest ground mass to minimize wildlife disturbance.

2. Glacier Bay National Park: Restricted from landings in non-motorized waters. Restrictions change seasonally, contact Glacier Bay staff for current restrictions (907-697-2230). Landings and takeoffs shall not be made on beaches or tidal flats or within one nautical mile of any tidewater glacier in the national park. If authorized by the Superintendent, helicopters may land at selected sites where deemed essential in the conduct of prospecting and mining activities.

3. Contact Information:

318 NOTICES

Kenai National Wildlife Refuge:

1. The operation of aircraft on the Kenai NWR, except in an emergency, is permitted only as authorized in designated areas as described below. These areas are also depicted on a map available from the refuge manager: Kenai NWR Manager, P.O. Box 2139, Soldotna, Alaska 99669, telephone (907) 262-7021.

(a) within the Canoe Lakes unit, Andy Simons unit, and Mystery Creek units of the Kenai Wilderness, ONLY the following lakes are designated for airplane operations:

Canoe Lake Unit

Scenic Lake, Nekutak Lake, Shoepac Lake, Norak Lake, Bird Lake, Grouse Lake, King Lake, Bedlam Lake, Taiga Lake, Vogel Lake, Cook Lake, Showshoe Lake, Wilderness Lake, Mull Lake, Tangerra Lake, and Sandpiper Lake.

Pepper Lake, Gene Lake, and Swanson Lake are ONLY open for sports icefishing.

Andy Simons Unit

Upper Russian Lake, Twin Lakes, Emerald Lake, High Lake, Lower Russian Lake, Iceburg Lake, Green Lake, Kolomin Lake, Pothole Lake, Harvey Lake, Martin Lake, Windy Lake, Dinglestad Glacier terminus lake, Wusnesenski Glacier terminus lake, Tustumena Lake, all wilderness lakes within one mile from the shoreline of Tustumena Lake and all unmanned lakes in sections 1 & 2, T.1 S., R.10 W, and section 4, 5, 8, & 9, T.1. S., R.9 W, Seward Mountain, AK.

Mystery Creek Unit

All unmanned lakes in section 11, T.6 N, R.5 W., Seward Mountain, AK.

(b) Airplanes may operate on all lakes outside of the Kenai Wilderness, except those lakes with recreational developments, including, but not limited to, campgrounds, campsites, and public hiking trails connected to road waysides. The non-wilderness lakes CLOSED to aircraft operations are as follows:

North Sterling Highway

Cashka Lake, Dolly Varden Lake, West Lake, Mosquito Lake, Watson Lake, Rainbow Lake, Dabbler Lake, Lili Lake, Forest Lake, Afonasi Lake, Upper Jean Lake, Anertz Lake, Weed Lake, Silver Lake, Breeze Lake, and Imeri Lake.

All lakes in the Skilak Loop Area (south of Sterling Highway and north of Skilak Lake) are closed to aircraft except that airplanes may land on Bottenintnim Lake, which is open year-round and Hidden Lake, which is open only for sport ice fishing.

South Sterling Highway

Headquarters Lake is restricted to administrative use only.

2. Notwithstanding any other provision of these regulations, the operation of aircraft is prohibited between May 1 and September 30, inclusive, on any lake where nesting trumpeter swans and/or their broods are present, except Windy and Lonesome Lakes where the closure is between May 1 and September 10, inclusive.

3. The operation of wheeled aircraft, at the pilot's own risk, is only authorized on the unmaintained Big Indian Creek Airstrip, on gravel areas with ½ mile of Wusnesenski Glacier terminus lake, and within the SE ¼, section 16 and SW ¼, section 15, T.4 S, R.8W., Seward Mountain.

4. Airplanes may operate only within designated areas on the Chickaloon Flats, as depicted on a map available from the refuge manager, (907) 262-7021.

5. Airplane operation is permitted on the Kasilof River, the Chickaloon River outlet, and the Kenai River below Skilak Lake from June 15 through March 14. All other rivers on the NWR are closed to aircraft.

16. Yukon Flats NWR — Fairbanks, AK — (907) 456-0440

Landing at State Refuges, Critical Habit Areas, and Sanctuaries**State of Alaska, Department of Fish and Game (ADF&G) website:**

<http://www.state.ak.us/adfg/habitat/geninfo/refuges/refuges.htm>

Alaska Department of Fish and Game, Juneau (907) 465-6160 phone, (907) 465-2772 fax

Region 1 — Southeast Alaska, (907) 267-2342 phone, (907) 267-2464 fax

Mendenhall Wetlands Refuge, Yakataga Refuge, Stan Price (Admiralty Island) Sanctuary, Chilkat River Critical Habitat Area, Dude Creek Critical Habitat Area

Region 2 — Southcentral and Western Alaska, (907) 267-2342 phone, (907) 267-2464 fax

Anchorage Coastal Refuge, Cape Newenham Refuge, Goose Bay Refuge, Izembek Refuge, McNeil River Refuge, Palmer Hay Flats Refuge, Susitna Flats Refuge, Trading Bay Refuge, Walrus Islands Sanctuary, McNeil River Sanctuary, Anchor River/Fritz Creek Critical Habitat Area, Chilkat River Critical Habitat Area, Cinder River Critical Habitat Area, Clam Gulch Critical Habitat Area, Copper River Delta Critical Habitat Area, Dude Creek Critical Habitat Area, Egegik Critical Habitat Area, Fox River Flats Critical Habitat Area, Homer Airport Critical Habitat Area, Kalgin Island Critical Habitat Area, Kachemak Bay Critical Habitat Area, Pilot Point Critical Habitat Area, Port Heiden Critical Habitat Area, Port Moller Critical Habitat Area, Redoubt Bay Critical Habitat Area, Tugidak Island Critical Habitat Area, and Willow Mountain Critical Habitat Area

Walrus Islands Sanctuary — Pilots are requested to maintain a minimum altitude of 5,000 feet above ground level within a 3 mile radius of Round Island (58°36'N, 159°58'W.). Access to Round Island or adjacent waters requires written permission from ADF&G. Flight less than 2,000 feet above ground level and than 1 mile may violate the Marine Mammal Protection Act and/or the Federal Airborne Hunting Act, regardless of their level of impact on wildlife.

McNeil River Sanctuary — Pilots are requested to maintain a minimum altitude of 1,000 feet above ground level within a 2 mile radius of McNeil River Falls located 1 mile upstream from the mouth of McNeil River in order to minimize disturbance to concentrations of brown bears during the period June 15 through September 15. The State has established a permit program which regulates human activities in the sanctuary and limits the number of persons allowed at the Falls each day.

Region 3 — Northern and Interior Alaska, (907) 459-7279 phone, (907) 456-2259 fax

Creamer's Field Refuge and Minto Flats Refuge

LANDING AT STATE PARKS AND RECREATION SITES**Civil/Military**

The landing of aircraft in Chugach State Park is prohibited except on Bold Airstrip. Practice landings and the dropping or pickup of objects or persons using aircraft are prohibited everywhere in the park without written permission of the Director, Alaska State Parks.

The use of aircraft is allowed in the following areas except for the purpose of practice landing:

- (1) Alaska Marine Parks
- (2) Bonnie Lake State Recreation Site
- (3) Captain Cook State Recreation Area
- (4) Denali State Park
- (5) Johnson Lake State Recreation Area
- (6) Kachemak Bay State Park
- (7) Kenai River Special Management Area
- (8) Long Lake State Recreation Area
- (9) Rocky Lake State Recreation Area
- (10) Wood-Tikchik State Park
- (11) Kachemak Bay State Wilderness Park (on saltwater and saltwater beaches)
- (12) Chilkat State Park (on saltwater).

NANCY LAKE STATE RECREATION AREA: Except as indicated below, the use of aircraft is allowed except for the purpose of practice landing. The use of float-equipped aircraft is prohibited on:

- (1) South Rolly Lake
 - (2) Bald Lake
 - (3) Tanaina Lake
 - (4) Milo Lake
 - (5) Ardaw Lake
 - (6) Jackknife Pond
 - (7) Frazer Lake
 - (8) Little Frazer Lake
 - (9) Charr Lake
 - (10) Owl Lake
 - (11) James Lake
 - (12) Chicken Lake
 - (13) Big Noluck Lake
 - (14) Little Noluck Lake
 - (15) Milo Pond
 - (16) the Echo Ponds
 - (17) Candlestick Lake
 - (18) Buckley Lake and
 - (19) Skeetna Lake.
-

LANDING AT DESHKA RIVER OUTDOOR RECREATION AREA**Extensive Use May 15 to July 15****CTAF Frequency 122.9****Civil/Military**

This area is located at approximately 61° 40'N 150° 19'W (Big Lake Vortac 275° 11.6NM). It is a very high use seasonal recreation area which is reached by float plane, wheel planes and boats. A large portion of these recreation area users are boaters. There are frequent conflicts between aircraft and boats within this area. The conflict occurs when aircraft utilize the river to drop off and pick up users.

LASER LIGHT DEMONSTRATIONS**Fairbanks, AK****Civil/Military**

Laser research is being conducted intermittently by the University of Alaska Geophysical Institute from the top of the Elvey Building, 800' MSL, located at 64 51 35.68N/147 50 50.25W, FAI 025/6.3, at an angle of 1 degree. This beam should not be a hazard to normal flight, but may be injurious to pilots'/passengers' eyes within 87 feet of the source. Cockpit illumination-flash blindness may occur beyond this distance. Fairbanks AFSS 907-474-0788 is the FAA coordination facility.

**BOEING FIELD/KING COUNTY INTERNATIONAL AIRPORT
SEATTLE, WASHINGTON****Civil/Military**

All users: Boeing Field Airport Traffic Control Tower is authorized to conduct simultaneous same direction operations to parallel runways, between sunrise and sunset, for Category II aircraft and smaller.

Temporary Flight Restrictions (TFRs) for Avalanche Control at**ATIGUN PASS -JUNEAU -THOMPSON PASS -TURNAGAIN ARM**

When necessary for avalanche control, the State of Alaska, Department of Transportation (DOT) will call Anchorage ARTCC Watch Desk (907) 269-1103 and request that TFRs be placed around areas of live firing for avalanche control. At times, they will only have an hour or two, for notification purposes, prior to firing. Listed below are the areas of control and altitudes that they will be requesting. The State of Alaska DOT employees will use the Pass name and Block numbers to refer to each individual TFR. The FAA will issue each NOTAM using the coordinates specified below.

ATIGUN PASS .

Surface to 12,600 feet MSL

5 NM radius, centered at 68°07'47"N 149°28'40"W

JUNEAU.

Surface to, 10,000 feet MSL

58°16'09"N 134°22'41"W to 58°18'08"N 134°22'13"W to 58°16'54"N.134°18'21"W to the point of beginning.

THOMPSON PASS

SFC TO 12,180 feet MSL (All BLOCKS)

BLOCK 1: 61°05'50"N 145°51'00"W (firing point) to 61°02'00"N 146°07'00"W to 61°11'00"N 146°04'00"W to point of beginning.

BLOCK 2: 61°09'04"N 145°43'22"W (firing point) to 61°13'43"N 145°28'27"W to 61°07'00"N 145°25'00"W to 61°02'00"N 145°33'00"W to point of beginning.

BLOCK 3: 61°12'26"N 145°28'24"W (firing point) to 61°19'25"N 145°24'34"W to 61°17'00"N 145°12'00"W to 61°09'00"N 145°13'00"W to point of beginning.

BLOCK 4: From 61°19'01"N 145°17'51"W (firing point) to 61°17'00"N 145°30'00"W to 61°21'00"N 145°36'00"W to 61°26'00"N 145°22'00"W to point of beginning.

TURNAGAIN ARM

Surface to 10,000 feet MSL (ALL BLOCKS)

BLOCK 1: From 60°58'00"N 149°25'30"W to 60°59'00"N 149°23'30"W to 60°57'45"N 149°18'00"W to 60°58'05"N 149°10'50"W to 60°57'05"N 149°09'55"W, then following the Alyeska Highway in a southerly direction to 60°56'30"N 149°10'15"W, then following the Seward Highway in a westerly direction to the point of beginning.

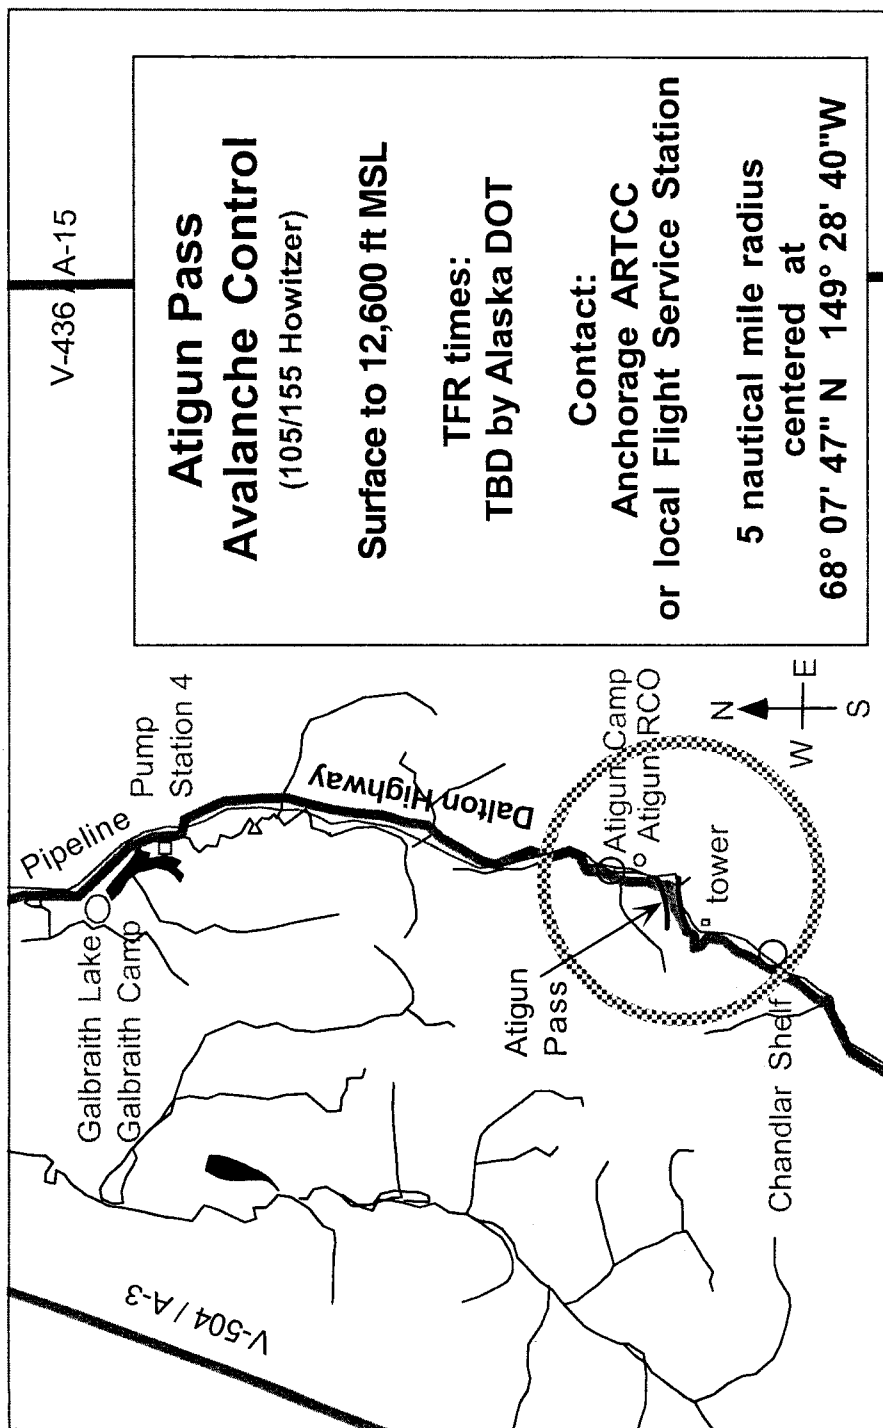

BLOCK 2: From 60°54'40"N 149°08'30"W to 60°56'40"N 149°05'20"W to 60°52'40"N 148°56'40"W to 60°51'30"N 149°00'40"W, then following the Seward Highway in a northwesterly direction to the point of beginning.

BLOCK 3: From 60°51'30"N 148°56'20"W to 60°49'30"N 148°38'00"W to 60°43'30"N 148°43'00"W to 60°46'30"N 148°59'00"W to the point of beginning.

BLOCK 4: From 60°43'10"N 149°03'20"W to 60°40'20"N 148°56'40"W to 60°36'30"N 149°00'10"W to 60°34'20"N 149°06'20"W to 60°36'35"N 149°08'40"W to 60°41'45"N 149°07'00"W to the point of beginning.

BLOCK 5: From 60°47'40"N 149°11'51"W to 60°46'30"N 149°08'00"W to 60°42'40"N 149°13'10"W to 60°43'00"N 149°16'20"W to 60°34'10"N 149°32'10"W to 60°30'50"N 149°25'40"W to 60°28'44"N 149°29'50"W to 60°33'00"N 149°36'20"W to 60°43'00"N 149°31'40"W to 60°46'25"N 149°24'00"W then in a southeasterly direction and northeasterly direction following the Seward Highway to the point of beginning.

BLOCK 6: 60°24'10"N 149°21'20"W to 60°24'20"N 149°16'20"W to 60°21'20"N 149°15'40"W to 60°21'10"N 149°21'10"W then following the Seward Highway in a northerly direction to the point of beginning.

Army Shadow Unmanned Aircraft System (UAS) Operations in Alaska

Five (5) UAS corridors will be used to transition the UASs from their launch areas to the Restricted Areas R-2202, R-2203, & R-2205. Information concerning the daily use of these corridors may be obtained by reviewing current NOTAMS or by contacting the Special Use Airspace Information Service for Donnelly, Allen, Firebird, and Husky Corridors. Information concerning the daily use of the Bryant Corridor can be obtained by reviewing current NOTAMS or by contacting Anchorage Approach. "The Department of the Army is responsible at all times for collision avoidance with nonparticipating aircraft and the safety of person or property on the surface during all phases of the UAS flight." At no time will the Shadow UAS fly in other than visual meteorological conditions (VMC). Operations of the Shadow UAS outside these defined corridors are not authorized.

Definition of the Corridors:

Allen Army Airfield (AAAF) corridor to R2202:

(a). Upon launch vicinity N66°00' W145°44' the UAS climbs to maintain VFR between 4,000 feet AGL and 6,000 AGL over the airfield and then departs on a westerly heading to N63°58' W145°49' over the Delta River, then southwest over the river for entry in R2202 at N63°57' W145°51'. The corridor will be 500 m either side of centerline. Altitude in the corridor will be between 4,000 and 6,000 feet AGL.

(b). Recovery procedures will follow the reverse course. Altitude in the corridor will be between 4,000 and 6,000 feet AGL. The UAS will maintain a minimum of 4,500 feet AGL until over the airfield before descending and beginning the approach.

Donnelly Flight Landing Strip (FLS) Corridor to R2202:

(a). Upon launch vicinity N63°50' W145°44' the UAS climbs to maintain VFR between 4,000 feet and 6,000 feet AGL over the FLS then departs on a westerly heading for 5 km for entry into R2202 at N63°50' W145°50'. The corridor will be 500 m either side of centerline. Altitude in the corridor will be between 4,000 and 6,000 feet AGL.

(b). Recovery procedures will follow the reverse course. The UAS will depart R2202 at N63°50' W145°50' on an easterly heading to the Donnelly FLS for recovery. The corridor will be 500 m either side of centerline. Altitude in the corridor will be between 4,000 feet and 6,000 feet AGL. The UAS will maintain between 4,000 feet and 6,000 feet AGL until over the FLS before descending and beginning the approach.

Firebird DZ Corridor to R2205:

(a). Upon launch the UAS climbs VFR to maintain between 4,000 feet AGL and 6,000 feet AGL and then departs the drop zone vicinity of N64°37' W146°39' on a northeasterly heading along Johnson Road for 4 km to N64°39' W146°36' for entry into R2205. The corridor will be 500 m either side of centerline. Altitude in the corridor will be between 4,000 feet and 5,000 feet AGL. Prior to launch the unit will contact Eielson Range Control by radio or telephone to ensure the airspace is clear purposes and to maintain visual contact with the UAS until it enters R2205.

(b). Recovery procedures will follow the reverse course. Altitude in the corridor will be between 4,000 feet and 6,000 feet AGL. The UAS will maintain between 4,000 and 6,000 feet AGL until over the DZ before descending and beginning the approach.

Husky DZ Corridor to R2205:

(a). Upon launch the UAS climbs VFR to between 4,000 feet AGL and 6,000 feet AGL and departs the drop zone vicinity of N64°46' W147°05' on an easterly heading for approximately 15 km to N64°45' W146°46' for entry into R2205. The corridor will be 500 m either side of centerline. Altitude in the corridor will be between 4,000 and 6,000 feet AGL. Prior to launch the unit will contact Eielson Range Control by radio or telephone to ensure the airspace is clear of traffic.

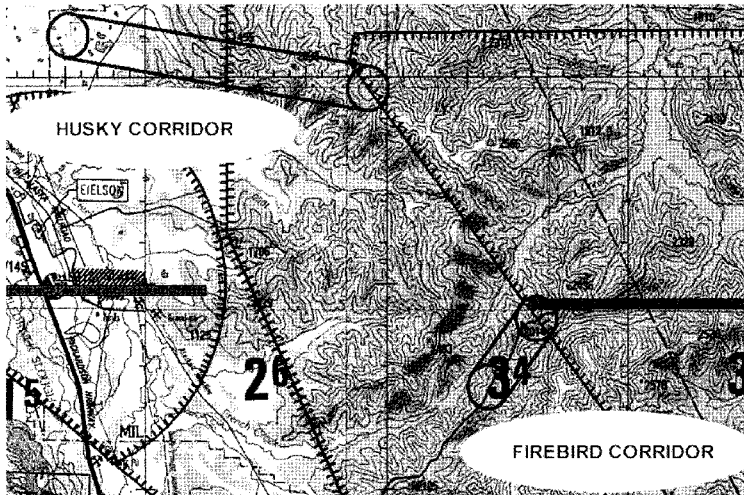

(b). Recovery procedures will follow the reverse course. Altitude in the corridor will be between 4,000 and 6,000 feet AGL. The UAS will maintain between 4,000 and 6,000 feet AGL until over the DZ before descending and beginning the approach.

Bryant Army Airfield Corridor to R2203:

(a). Upon launch vicinity N61°16' W149°40' the UAS departs heliport on a northerly heading to N61°17' W149°39' for entry into R2203. The corridor will be 500 m either side of centerline. Altitude in the corridor will be at or below 2,000 feet AGL. Prior to launch the unit will monitor and then broadcast intended launch on the Bryant AAF CTAF frequency.

(b). Recovery procedures will follow the reverse course. Altitude in the corridor will be at or below 2,000 feet AGL.

US ARMY UAS Corridors

High Frequency Active Aurora Research Program HAARP

The HAARP Research Station is located on property owned by the U.S. Air Force and is jointly managed by the Air Force Research Laboratory and the Office of Naval Research. The site location of the HAARP Research Station was chosen to take advantage of specific ionospheric features found in limited geographic regions of the world. The occurrence of these features (like the auroral electrojet) cannot be predicted on a daily or even hourly basis. Experiments of opportunity address the study of these features by standing by to conduct the experiment should conditions become favorable. Preparations may occur on consecutive days for two weeks at a time even though experiments may be conducted on only one or two occasions or not at all.

The goal of the research to be conducted at the HAARP facility is to improve the general knowledge of ionospheric effects on military and civilian communication and navigation systems. The type of research to be conducted falls into two categories: (1) Active or interactive research requiring the use of a high power, HF transmitter system (Ionospheric Research Instrument-IRI) and (2) Passive research involving monitoring instruments only. The later activity does not require use of high power emitters. Interactive ionospheric research, which can be conducted through the use of a high power transmitter, is currently being conducted in the lower 48 and other countries at similar facilities.

Although the HF transmitter has been designed and constructed to suppress out-of-band electromagnetic (EM) radiation, at sufficiently close ranges to the HF antennas used for this research, radio interference to aircraft systems may be possible within 5 nautical mile radius and up to an altitude of 50,000 feet. The IRI is a fixed system and the field strengths associated with its antenna system decreases in a known, methodical manner with absolute distance from the antenna. The rate of decrease is inverse to distance and the strength drops rapidly to levels typical of those encountered in the vicinity of AM/FM/TV broadcast stations.

An aircraft alert radar will be used to monitor the airspace within 5 nautical mile radius of the HAARP site, located at milepost 11.3 Tok Highway, during all research operations involving the high power HF transmitter system. The video display for this radar is located immediately adjacent to the control operator position for the HF transmitter in the operations control center. A dedicated operator will be assigned to monitor the radar display. All aircraft transitioning near the HAARP site will be allowed to do so without risk from the research operations. No operation of the IRI will occur while aircraft are detected within 5 nautical miles.

Aircraft can contact the HAARP Test Director on VHF frequency 122.25 to ensure their safe transition around the site or to get current project status. The HAARP Test Director can also be reached at (907) 822-5521.

DENALI FLIGHT ADVISORY

1. The Denali National Park/Wilderness/National Preserve areas are divided into two sectors, North and South, for Common Traffic Advisory Frequency (CTAF) deconfliction. The South area will use 123.65 and the North Area will use 122.725. The surrounding airports will use CTAF 122.9. A detailed map, Denali Flight Advisory, depicts the local checkpoints and is available through the National Park Service, PO Box 9, Denali National Park, AK 99755 or call 683-2294.
2. The NPS chart depicts the reporting points. When making a position report, give location, altitude, destination and/or direction of flight. Example: "Mountain Traffic, Cessna 1234, Ruth Icefall, 8000 feet, up glacier for the Amphitheater."
3. ALL AIRCRAFT SHOULD FLY WITH THEIR LIGHTS ON.
4. BE ALERT! Climb early, stay high, especially over areas where landings and departures take place. Be sure your aircraft has the performance capability to operate in a high altitude mountainous environment. Stay to the right in the valleys and canyons. All turns should be to the left if possible. Obtain a current altimeter setting from the nearest facility.
5. Remember, Mt. McKinley makes its own weather. If the weather begins to deteriorate, leave immediately.
6. Tour aircraft may have their radios turned down to talk to their passengers and therefore may miss a report. ALWAYS presume that other aircraft may be in your area and might have missed your call.
7. Be sure you report the correct altitude you are flying in order to maximize separation and minimize the mid-air potential.
8. The National Park Service at Denali National Park and Preserve performs numerous rescues along the Alaska Range and on Mt. McKinley. Rescues are often performed using the high altitude Lama helicopter, fixed wing, and military aircraft. Please stay well away from rescue sites. Listen and obey airspace closures around rescue operations.
9. Be sure to brush up on your mountain flying techniques before flying in the Denali Park Area. There are many excellent books and pamphlets available. Consider reviewing your skills with a flight instructor.
10. Alert: Triple Lakes has the largest volume of traffic in July with an estimated aircraft crossings of 200 per day.

DENALI STATE PARK

Denali State Park borders the national park on its southeast corner between the Dutch Hills to the west and to the Susitna River on the east. The George Park Highway runs through the middle of the park. State requirements for aviators operating within the state park.

1. Landings of fixed wing aircraft in DSP are permitted west of the Parks Hwy and on Blair and Ermine Lakes. Landings are not permitted on Byers Lake and on Kesugi and Curry Ridges, which are all east of the highway.
2. Practice landings are not permitted.
3. Helicopters landings are restricted to five specific sites west of the highway.
4. For detailed information on these sites for planning purposes, please phone (907) 745-3975.

Denali Flight Advisory

Common Traffic Advisory Frequencies

North Denali: 122.725

South Denali: 123.65

Airport: 122.900

WHITE MOUNTAIN FLIGHT ADVISORY

The graphic depicts the routes that are flown by flight seeing commercial aircraft between Fairbanks and Fort Yukon and Fairbanks and the Arctic Circle, over the White Mountains. Aircraft are encouraged to use the Common Traffic Advisory Frequency 122.750 to make position reports.

The chart depicts the reporting points. The coordinates for reporting points are listed below, along with altitudes used for each segment of flight. When making a position report. Example: White Mountain Traffic, Cessna 1234, Lime Peak, 7500 feet, enroute Fort Yukon.

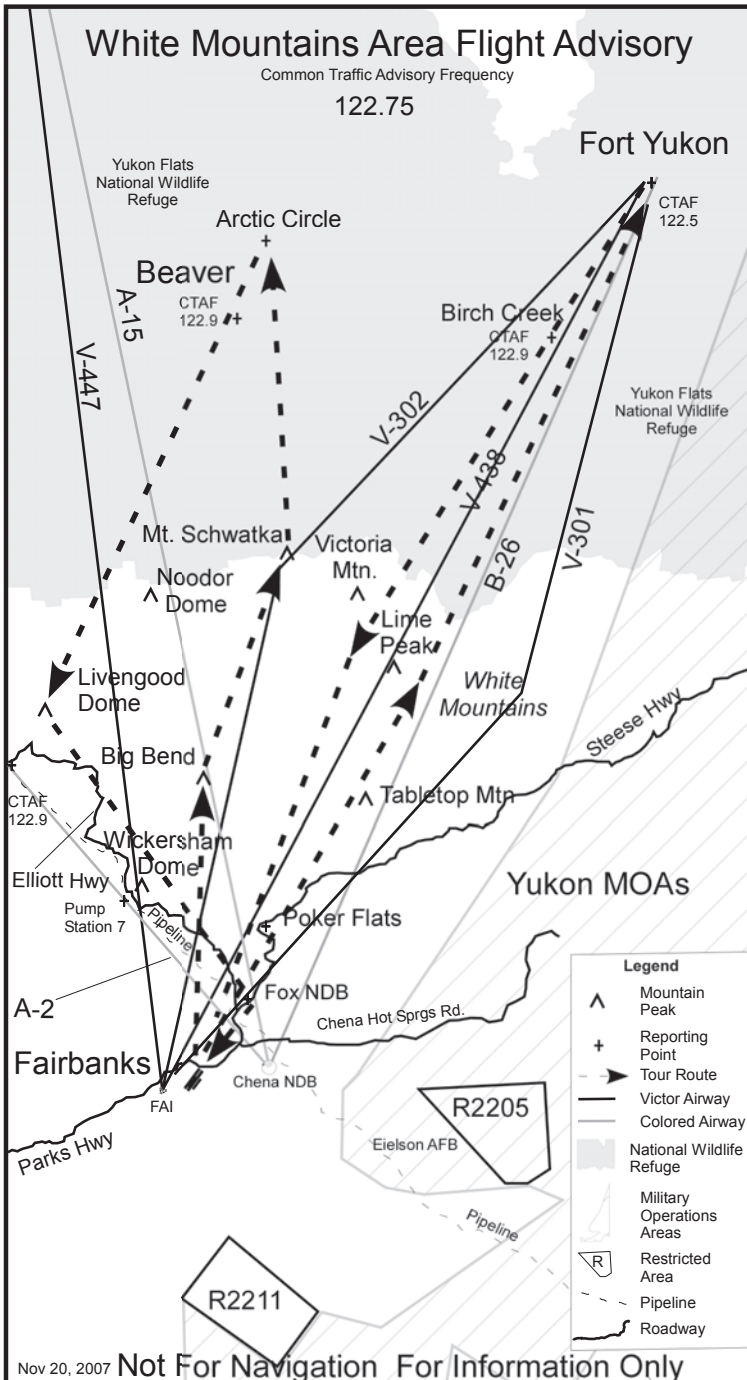

ALL AIRCRAFT SHOULD FLY WITH THEIR LIGHTS ON. Be aware that routes may cross or parallel IFR airways.

BE ALERT! Climb early, stay high. Be sure your aircraft has the performance capability to operate in mountainous terrain. Obtain a current altimeter setting from the nearest facility. Check weather for route of flight.

Tour aircraft may have their radios turned down to talk to their passengers and therefore may miss a report. ALWAYS presume that other aircraft may be in your area and might have missed your call. Be sure you report the correct altitude you are flying in order to maximize separation and minimize the mid-air potential.

Be sure to brush up on your mountain flying techniques before flying in the mountains. There are many excellent books and pamphlets available. Consider reviewing your skills with a flight instructor.

Waypoints	Latitude	Longitude	Elevation
Fairbanks	64°48'49"	147°51'35"	434

Preferred Arrival and Departure Routes into St. George and St. Paul Islands

The National Marine Fisheries Service and the U.S. Fish and Wildlife Service requests pilots maintain a minimum altitude of 1,000 feet above ground level (AGL) within a 1 mile radius of any of the coastline of the Pribilof Islands (St. Paul, St. George, Sea Lion Rock, Walrus, and Otter Islands) from 14 May until 14 December. Flights less than 1,000 feet AGL and less than 1 mile seaward or 1/2 mile leeward may harass marine mammals and seabirds. Harassment of wildlife may increase the incidence of bird strikes and violate the Marine Mammal Protection Act.

During approach and takeoff from St. George to the east a right bank turn is recommended between 1/2 mile and 1 mile from the end of the runway to heading 060°T or 240°T. During approach and takeoff from St. Paul follow aircraft advisory corridors to the north and south. Inter-island flights along heading 138°T or 318°T should avoid the aircraft advisory zones if less than 1,000' AGL and within 1 mile of any coastline except as recommended above.

National Marine Fisheries Service point of contact:
(907) 271-3024

Iliamna Airport
Traffic Patterns, Communications and Aircraft Operations

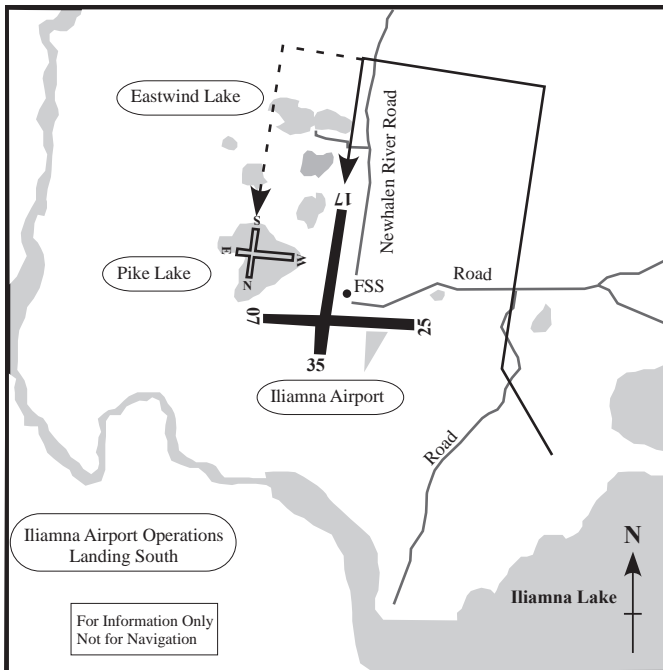

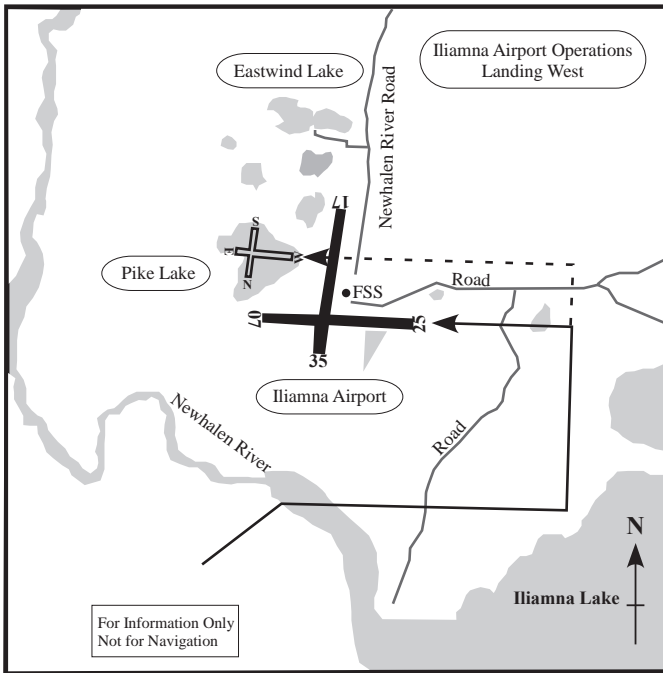

When winds allow, float equipped aircraft should land in a direction that will not place them over the airport or in conflict with the airport traffic patterns. For Pike Lake this generally means landing to the East. When winds require an approach over the airport, the float aircraft shall give right of way to wheeled aircraft on approach to the airport. When winds are such velocity that aircraft cannot land as described above, float aircraft can fly the pattern with wheel-equipped aircraft and sidestep to a landing on the lake.

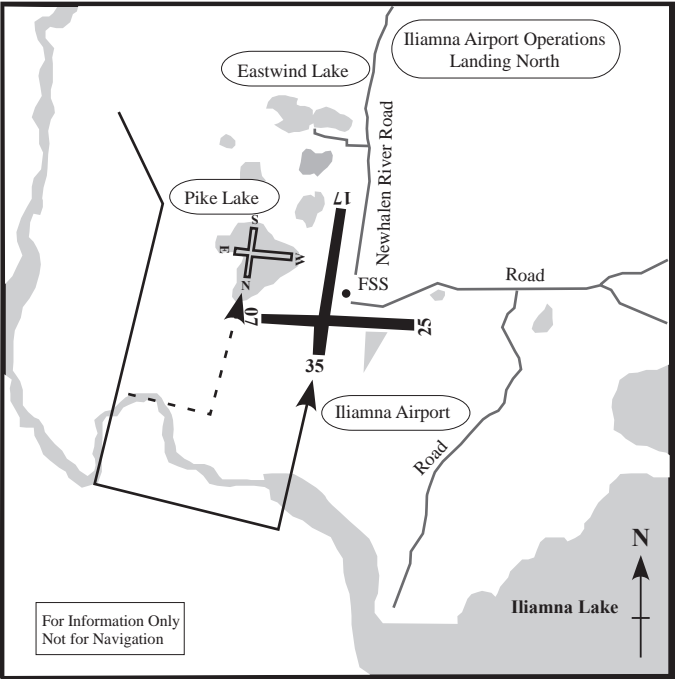

Departure Procedures

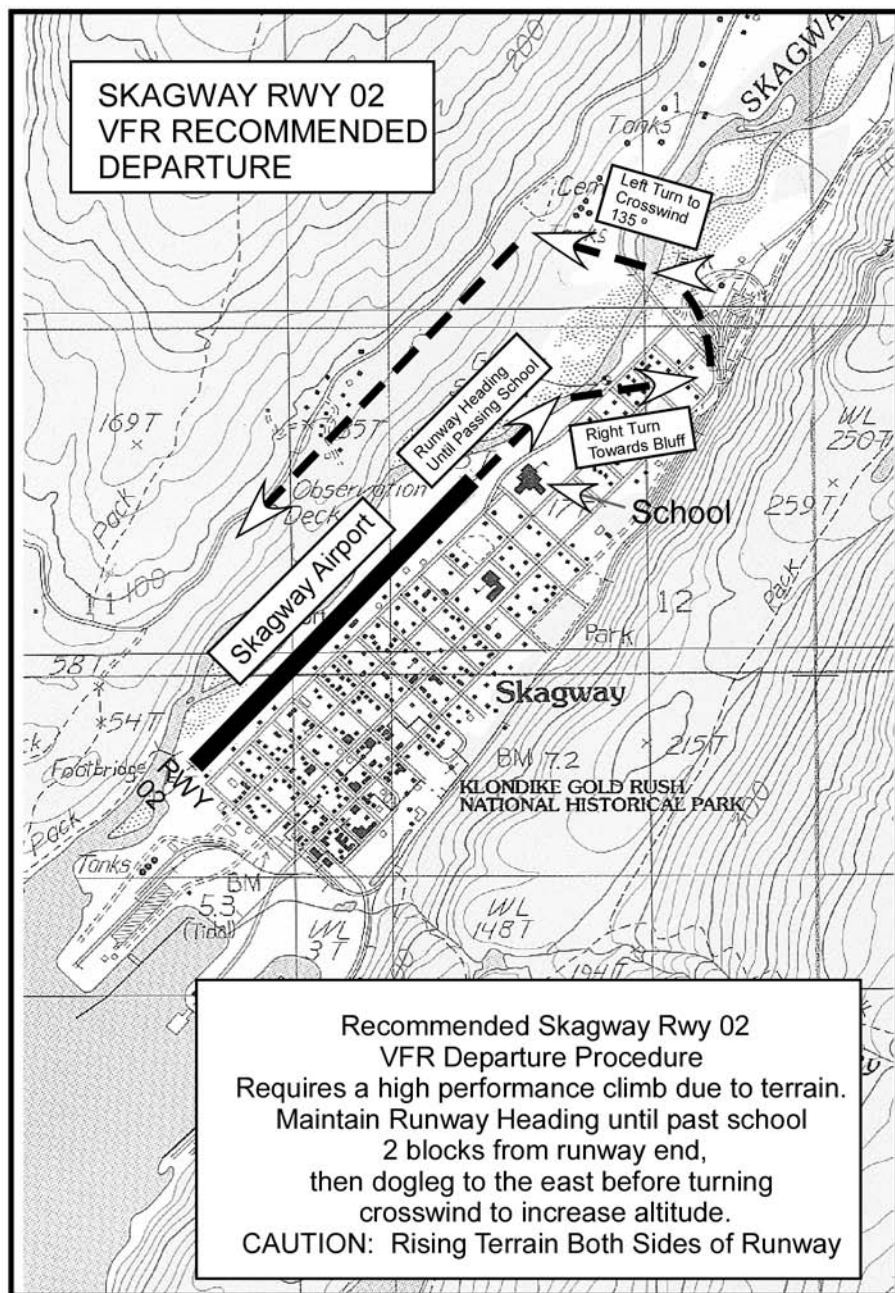

Aircraft departing the Iliamna airport VFR will make standard departures as described in the Aeronautical Information Manual. Aircraft departing Pike Lake should either depart away from the main airport, or sequence their departures using radio communication so they are departing behind the wheel-equipped aircraft.

When arriving Iliamna runways 17 and S or departing runways 35 and N caution is advised for occasional, float and wheel-equipped, operations in the vicinity of Eastwind Lake. Pilots are strongly urged to utilize Local Airport Advisory services when the Iliamna FSS is open and to utilize the CTAF on 123.6 during other times.

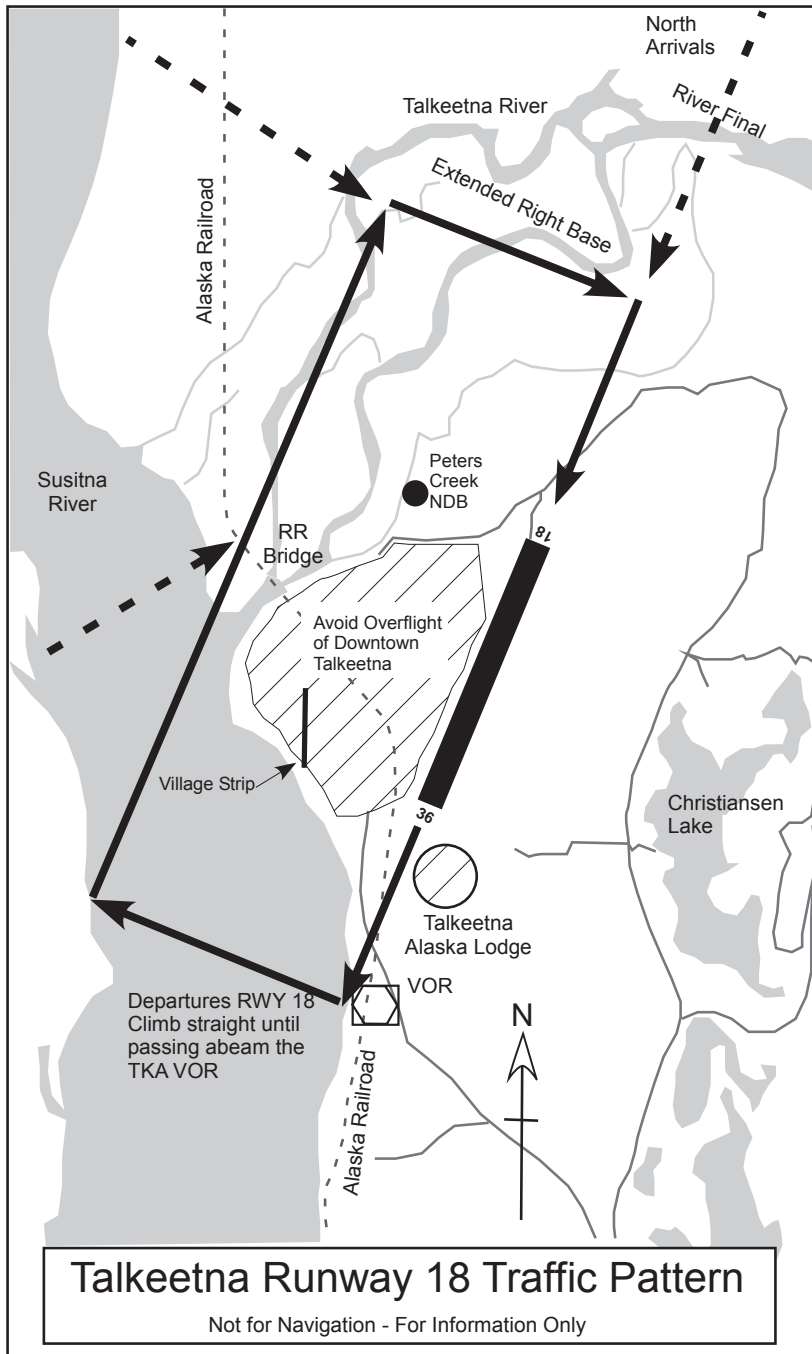

It is strongly recommended that all aircraft utilize the CTAF on 123.6.

ANCHORAGE, ALASKA, TERMINAL AREA RULES**I. General rule: All segments.**

(a) Each person operating an aircraft to within the Anchorage, Alaska, Terminal Area shall operate that aircraft according to the rules set forth in this section and the International, Lake Hood, Merrill, Elmendorf, Bryant, or Seward segments unless otherwise authorized or required by ATC.

(b) Each person operating an airplane within the Anchorage, Alaska Terminal Area shall conform to the flow of traffic depicted on the appropriate aeronautical charts.

(c) Each person operating a helicopter shall operate it in a manner so as to avoid the flow of airplanes.

(d) Except as provided in Elmendorf segment (d) and (e), Bryant segment (b), and Seward segment (a), (b) and (c), each person operating an aircraft in the Anchorage, Alaska, Terminal Area shall operate that aircraft only within the designated segment containing the arrival or departure airport.

(e) Except as provided in Merrill segment (d) and Bryant segment (b), each person operating an aircraft in the Anchorage, Alaska, Terminal Area shall maintain two-way radio communications with the ATCT serving the segment containing the arrival or departure airport.

II. General rules: International segment.

(a) No person may operate an aircraft at an altitude between 1,200 feet MSL and 2,000 feet MSL in that portion of this segment lying north of the midchannel of Knik Arm.

(b) Each person operating an airplane at a speed of more than 105 knots within this segment (except that part described in paragraph (a) of this section) shall operate that airplane at an altitude of at least 1,600 feet MSL until maneuvering for a safe landing requires further descent.

(c) Each person operating an airplane at a speed of 105 knots or less within this segment (except that part described in paragraph (a) of this section) shall operate that airplane at an altitude of at least 900 feet MSL until maneuvering for a safe landing requires further descent.

III. General rules: Lake Hood segment.

(a) No person may operate an aircraft at an altitude between 1,200 feet MSL and 2,000 feet MSL in that portion of this segment lying north of the midchannel of Knik Arm.

(b) Each person operating an airplane within this segment (except that part described in paragraph (a) of this section) shall operate that airplane at an altitude of at least 600 feet MSL until maneuvering for a safe landing requires further descent.

IV. General rules: Merrill segment.

(a) No person may operate an aircraft at an altitude between 600 feet MSL and 2,000 feet MSL in that portion of this segment lying north of the midchannel of Knik Arm.

(b) Each person operating an airplane at a speed of more than 105 knots within this segment (except for that part described in paragraph (a) of this section) shall operate that airplane at an altitude of at least 1,200 feet MSL until maneuvering for a safe landing requires further descent.

(c) Each person operating an airplane at a speed of 105 knots or less within this segment (except for that part described in paragraph (a) of this section) shall operate that airplane at an altitude of at last 900 feet MSL until maneuvering for a safe landing requires further descent.

(d) Whenever the Merrill ATCT is not operating, each person operating an aircraft either in that portion of the Merrill segment north of midchannel of Knik Arm, or in the Seward Highway segment at or below 1200 feet MSL, shall contact Anchorage Approach Control for wake turbulence and other advisories. Aircraft operating within the remainder of the segment should self-announce intentions on the Merrill Field CTAF.

V. General rules: Elmendorf segment.

(a) Each person operating a turbine-powered aircraft within this segment shall operate that aircraft at an altitude of at least 1,700 feet MSL until maneuvering for a safe landing requires further descent.

(b) Each person operating an airplane (other than turbine-powered aircraft) at a speed of more than 105 knots within this segment shall operate that airplane at an altitude of at least 1,200 feet MSL until maneuvering for a safe landing requires further descent.

(c) Each person operating an airplane (other than turbine-powered aircraft) at a speed of 105 knots or less within the segment shall operate that airplane at an altitude of at least 800 feet MSL until maneuvering for a safe landing requires further descent.

(d) A person landing or departing from Elmendorf AFB; may operate that aircraft at an altitude between 1,500 feet MSL and 1,700 feet MSL within that portion of the International and Lake Hood segments lying north of the midchannel of Knik Arm.

(e) A person landing or departing from Elmendorf AFB, may operate that aircraft at an altitude between 900 feet MSL and 1,700 feet MSL within that portion of the Merrill segment lying north of the midchannel of Knik Arm.

(f) A person operating in VFR conditions, at or below 600 feet MSL, north of a line beginning at the intersection of Farrell Road and the long. 149°43'08"W.; thence west along Farrell Road to the east end of Sixmile Lake; thence west along a line bearing on the middle of Lake Lorraine to the northwest bank of Knik Arm; is not required to establish two-way radio communications with ATC.

VI. General rules: Bryant segment.

(a) Each person operating an airplane to or from the Bryant Airport shall conform to the flow of traffic shown on the appropriate aeronautical charts, and while in the traffic pattern, shall operate that airplane at an altitude of at least 1,000 feet MSL until maneuvering for a safe landing requires further descent.

(b) Each person operating an aircraft within the Bryant segment should self-announce intentions on the Bryant Airport CTAF.

VII. General rules: Seward Highway segment.

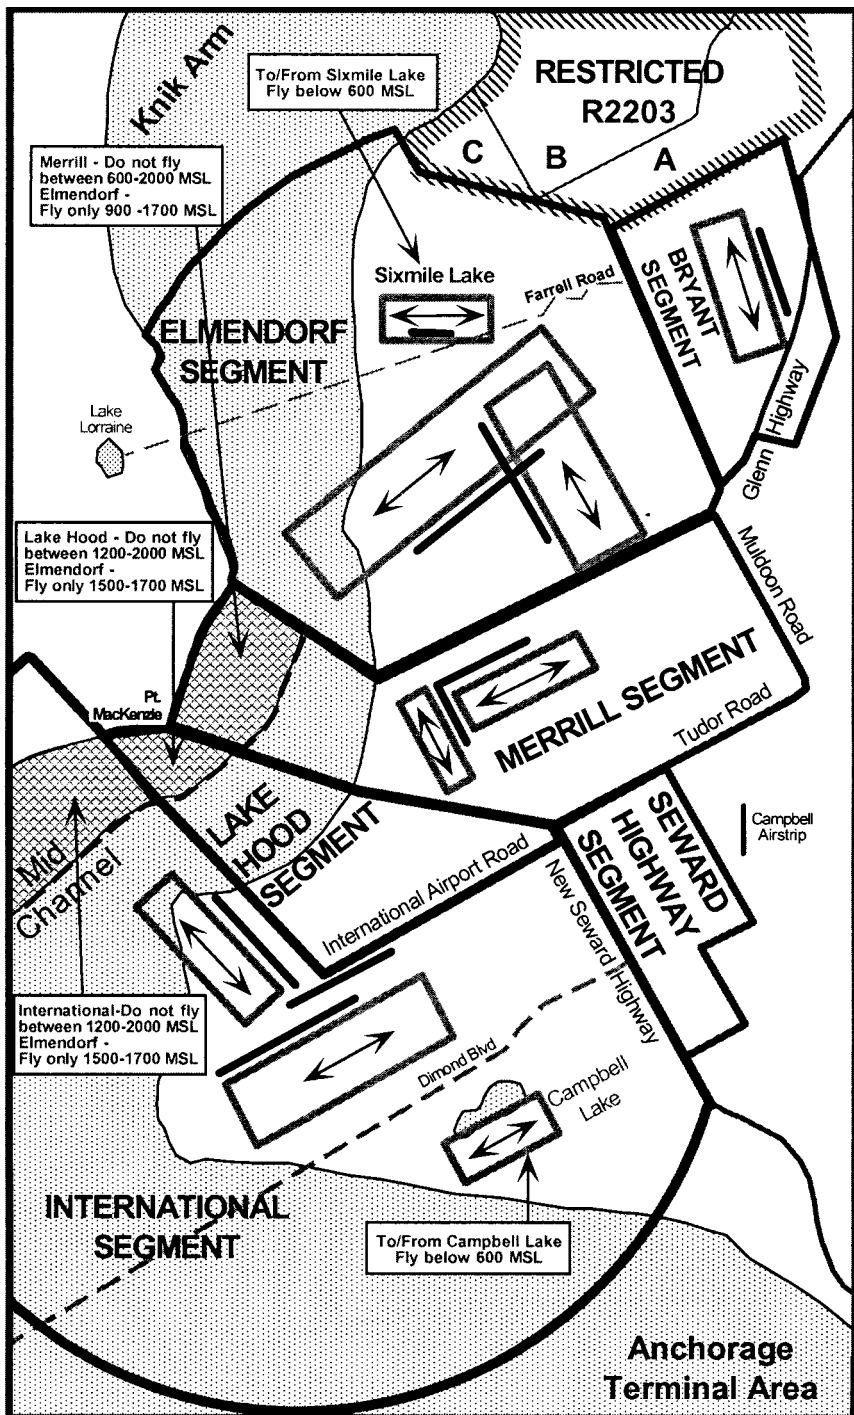

(a) Each person operating an airplane in the Seward Highway segment shall operate that airplane at an altitude of at least 1,000 feet MSL unless maneuvering for a safe landing requires further descent.

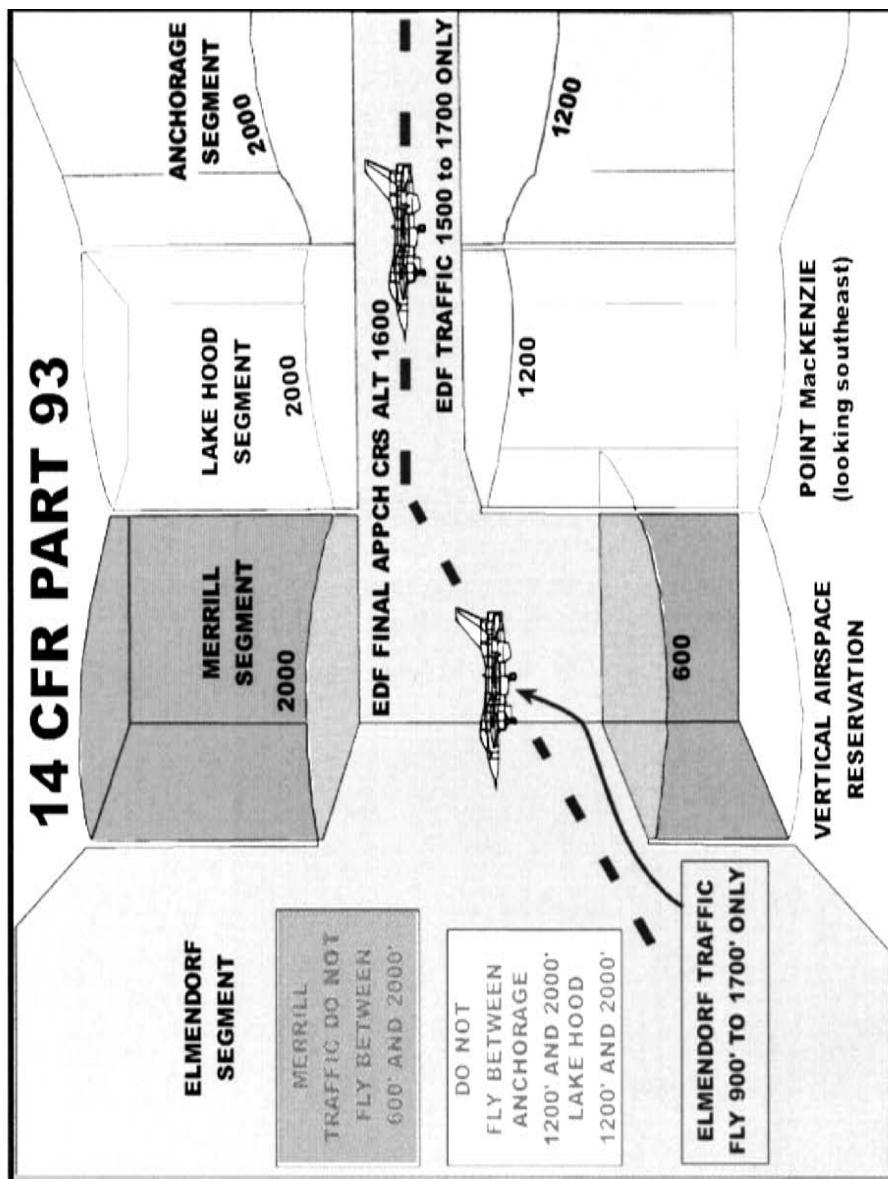

(b) Each person operating an aircraft at or below 1,200 feet MSL that will transition to or from the Lake Hood or Merrill segment shall contact the appropriate ATCT prior to entering the Seward Highway segment. All other persons operating an airplane at or below 1,200 feet MSL in this segment shall contact Anchorage Approach Control.

(c) At all times, each person operating an aircraft above 1,200 MSL shall contact Anchorage Approach Control prior to entering the Seward Highway segment.

VIII. Special requirements, Lake Campbell and Sixmile Lake Airports.

(a) Each person operating an aircraft to or from Lake Campbell or Sixmile Lake Airport shall conform to the flow of traffic for the Lake operations that are depicted on the appropriate aeronautical charts.

ANCHORAGE, ALASKA	VFR TRANSITION ROUTE	POWER LINE TRANSITION ALL ANCHORAGE AREA AIRPORTS AND SEAPLANE BASES	
ROUTE PURPOSE: The POWER LINE TRANSITION is for VFR aircraft whose route of flight follows the north shoreline of Cook Inlet. This route enhances wake turbulence separation from aircraft using Ted Stevens Anchorage International Airport and Elmendorf AFB.			
ANCHORAGE APP CON 119.1	ANCHORAGE ATIS 118.4 TOWER 118.3	LAKE HOOD ATIS 125.6 TOWER 126.8	MERRILL ATIS 124.25 TOWER 126.0
			
VFR PROCEDURE ONLY CHART NOT TO SCALE -- NOT TO BE USED FOR NAVIGATION			
ROUTE INSTRUCTIONS: ARRIVING AIRCRAFT: Fly along the power lines on the north side. Maintain at or below 600' MSL until Power Line Bend. DEPARTING AIRCRAFT: <u>Fly one mile north of the power lines.</u> Maintain at or below 600' MSL until crossing the Little Susitna River.

ANCHORAGE, ALASKA		SVFR ARRIVAL/DEPARTURE PROCEDURE	NONAME SVFR ARRIVAL / DEPARTURE MERRILL FIELD
ROUTE PURPOSE: The NONAME ARRIVAL/DEPARTURE route is for aircraft transitioning to and from the area north and west of Merrill Field when weather is below basic VFR minima. PILOTS MUST REQUEST SVFR CLEARANCE; CONTROLLERS MAY NOT INITIATE SVFR OPERATIONS.			
ATIS 124.25	GROUND CONTROL 121.7	MERRILL TOWER 126.0	DEPARTURE CONTROL 119.1
			
SVFR PROCEDURE ONLY CHART NOT TO SCALE -- NOT TO BE USED FOR NAVIGATION			
ROUTE INSTRUCTIONS: ALL AIRCRAFT: IFR operations receive priority over SVFR requests. DEPARTURES: Request SVFR clearance from Merrill Ground Control. After airborne, maintain SVFR at or below 1200', proceed direct to the mouth of Ship Creek, then direct to Point Noname. ARRIVALS: Request SVFR clearance from Anchorage Approach Control on 119.1. After receiving clearance, maintain SVFR at or below 1200', proceed from over Point Noname direct to the mouth of Ship Creek, then as directed by ATC.			
Go to: www.alaska.faa.gov/ata for more information.			6/07

Notes for the Fairbanks Area

Fairbanks General Guidelines

1. Each person operating an aircraft within the Fairbanks Terminal Radar Service Area (TRSA) should operate that aircraft according to the rules set forth in this section unless otherwise authorized or required by ATC.
2. Each person operating a helicopter shall operate it in a manner so as to avoid the flow of airplanes.
3. All aircraft while in the Fairbanks Surface Area should fly with their lights on at all times.
4. Arriving aircraft should contact Fairbanks Approach at least 20 miles from the airport of arrival destination. Arriving traffic northeast through east through southeast of Fairbanks International Airport should contact Fairbanks Approach on 126.5. All other arrivals should contact Fairbanks Approach on 125.35.
5. All aircraft arriving Fairbanks International Airport on downwind from the north or south remain at least 1 mile east or west of the extended runway centerlines for Fairbanks International RWYs 1/19.

Fairbanks Traffic Pattern Altitudes

Aircraft arrival/departure altitudes may vary from these listed:

Reciprocating-engine	1,500 MSL
Large and turbine powered aircraft	2,000 MSL

Chena Marina procedures

1. Arrival/departure/pattern traffic for Chena Marina contact Fairbanks Tower on 118.3.
2. Chena Marina traffic will observe a ceiling of 1,200 MSL while in the pattern.
3. Traffic patterns will be to the west of the Chena Marina runway and float pond with Chena Ridge being the western boundary.
4. All Chena Marina traffic will remain west of Chena Pump Road at or below 1200 MSL and will advise Fairbanks Tower prior to crossing Chena Pump Road eastbound.
5. Departure traffic remains west of Fairbanks International Airport at all times unless otherwise authorized or required by ATC.
6. In the interest of safety, please utilize Fairbanks Radar Services whenever departing Chena Marina.

TRSA Services**A. Standard TRSA departure instructions**

Departing aircraft should monitor the ATIS, then contact Fairbanks Clearance Delivery on the appropriate frequency being broadcast on the ATIS prior to taxi. Pilots are expected to inform the controller of an intended destination and/or initial heading and desired cruising altitude. All departing aircraft will be given TRSA services unless the pilot states "negative TRSA service" or makes a similar comment.

B. TRSA departure (VFR departing aircraft)

The standard TRSA departure for Fairbanks International Airport will be to fly runway heading for the runway assigned, departure frequency on 125.35. This will be referred to as the "TRSA departure". Fairbanks Clearance Delivery will issue to each aircraft: "TRSA departure, squawk (code)".

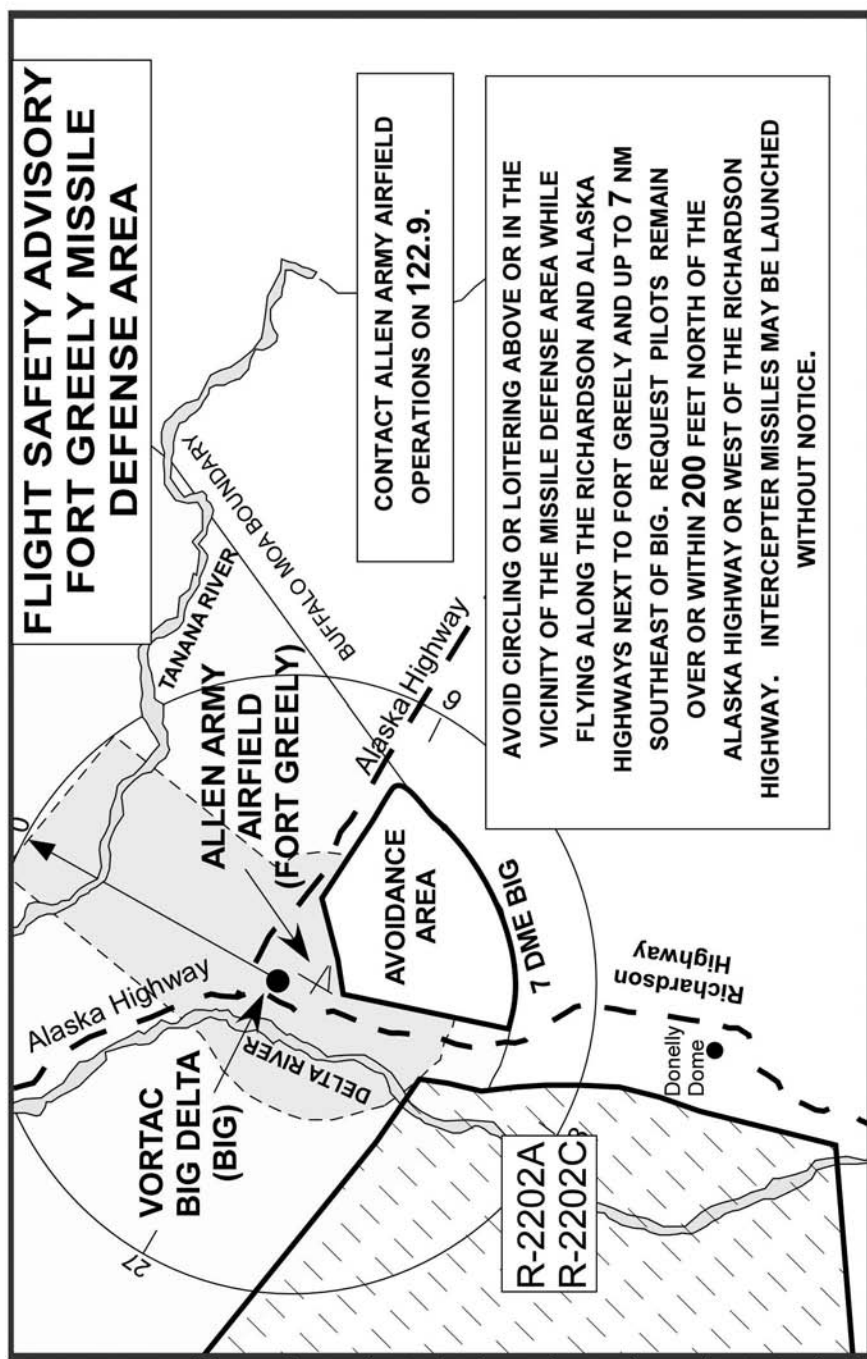

C. TRSA service from Float Pond

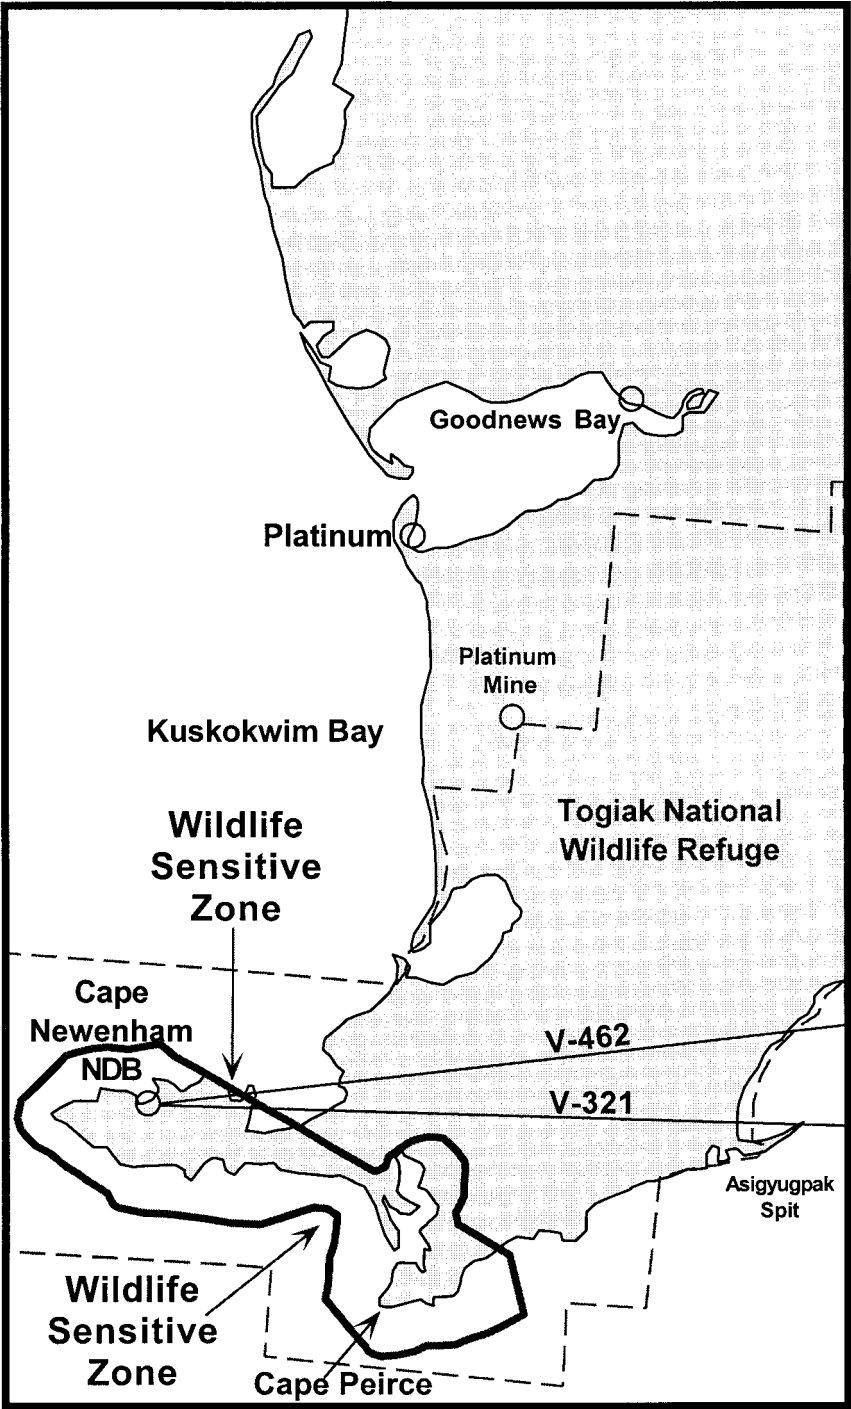

Clearance Delivery frequency stated on ATIS. Aircraft departing the Float Pond at Fairbanks International Airport should monitor the ATIS, then contact Fairbanks Clearance Delivery for services. Those departing aircraft should then contact Fairbanks Tower 118.3 directly for taxi clearance.

D. TRSA service from satellite airports

Clearance Delivery frequency stated on ATIS. Aircraft departing satellite airports, inside the Fairbanks Class D surface area, such as Chena Marina, Chena River, Metro Field, and Peger Pond, and requesting TRSA services should monitor the ATIS, then contact Fairbanks Clearance Delivery for TRSA services. Those departing aircraft should then contact Fairbanks Tower directly on 118.3.

**YOUR SUPPORT AND COOPERATION IS REQUESTED TO
MINIMIZE DISTURBANCE TO WALRUS RESTING
AT CAPE NEWENHAM AND CAPE PEIRCE**

These are important resting areas for Pacific Walrus. Each summer, thousands of walrus migrate into Bristol Bay to feed on rich beds of clams and other marine organisms. Between feeding cycles, they come to shore to rest at isolated resting areas (haulouts) distributed around the shoreline in the Togiak National Wildlife Refuge. In recent years, the number of walrus using the haulouts in the refuge has increased substantially and these haulouts have become one of the most important resting areas for walrus in Alaska.

Walrus are sensitive to Human Disturbances. Although responses to human activities are variable, walrus will often flee haulouts in response to the sight, sound, or odor of humans or their machines. Trampling deaths associated with haulout disturbance is one of the largest known sources of natural mortality for walrus. Frequent or prolonged disturbances may even result in long term haulout abandonment.

Disturbing Walrus is against the law. Operating an aircraft or boat in a manner which results in disturbing, harassing, herding, hazing, or driving of walrus is prohibited under provisions of the Marine Mammals Protection Act and Federal Airborne Hunting Act.

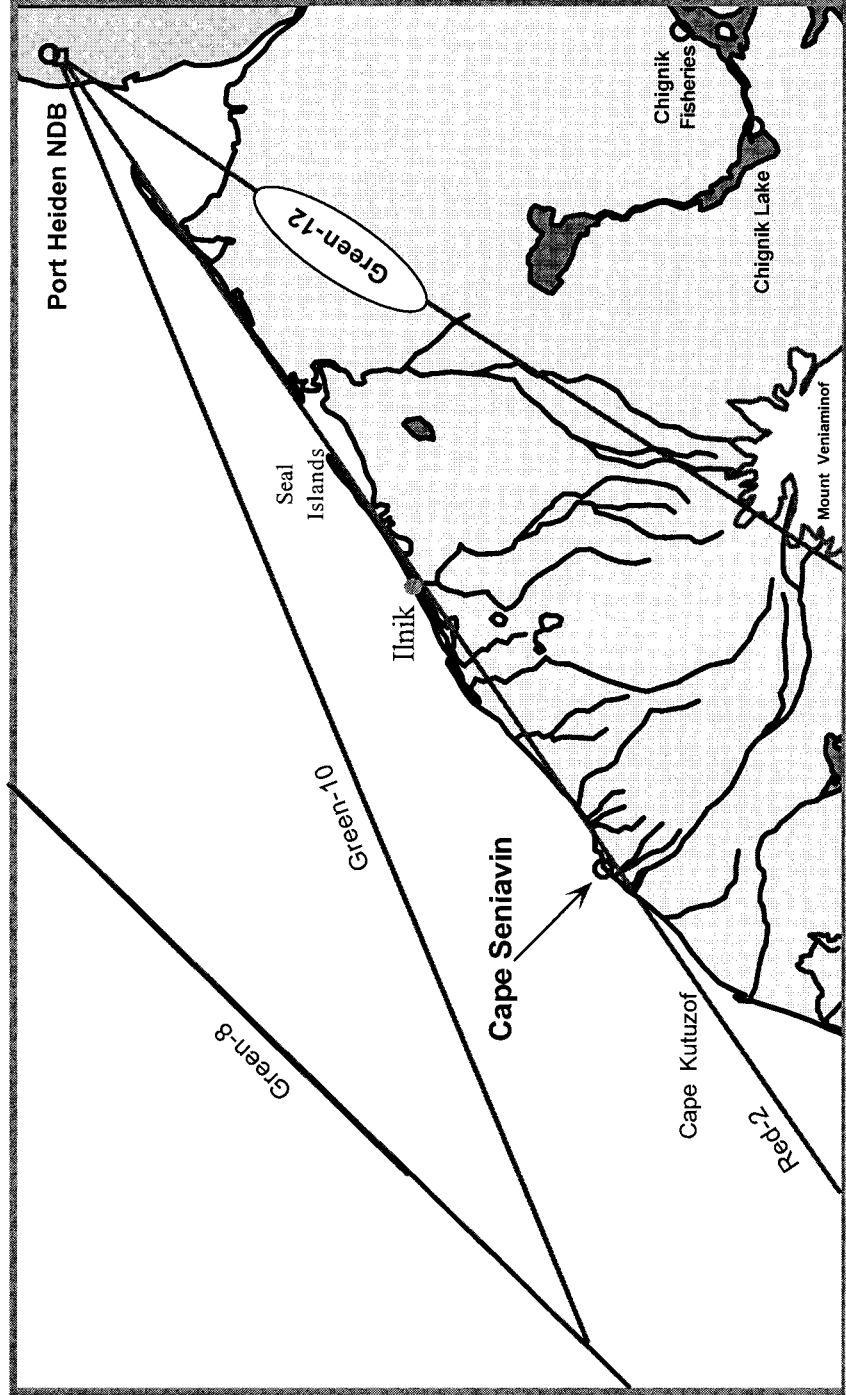

You can help minimize disturbances to Walrus at Cape Newenham and Cape Peirce.

To ensure that walrus are not disturbed, please follow these guidelines between April 1st and October 31st when traveling near Cape Newenham and Cape Peirce:

- + Fixed wing aircraft remain at altitudes greater than 2,000 feet above ground level (AGL) within 1/2 mile of the Togiak National Wildlife Refuge boundary. Helicopters remain at altitudes greater than 5,000 feet AGL within one (1) nautical mile of the boundary. If cloud conditions necessitate flying lower than these recommended altitudes, please pass inland to avoid flushing walrus from the beach.
- + Walrus are particularly sensitive to changes in engine noise and are more likely to stampede off beaches when planes turn or fly low overhead - please avoid circling or turning while in the area of the haulout.
- + Aircraft visiting Togiak National Wildlife Refuge should land well away from the haulout and only taxi as close to the haulout as is necessary for landing and take off. Approaching the haulout by foot will greatly reduce the amount of disturbance to the animals resting at the haulout.
- + Marine vessels are requested to remain at least 1/2 mile from shore when transiting past Cape Newenham and Cape Peirce.

**To report incidences of harassment contact:
USFWS Law Enforcement Division: 1-800-858-7621**

**YOUR SUPPORT AND COOPERATION IS REQUESTED TO
MINIMIZE DISTURBANCE TO WALRUS RESTING AT CAPE SENIAVIN**

Cape Senivan is an important resting area for Pacific Walrus. Each summer, thousands of walrus migrate into Bristol Bay to feed on rich beds of clams and other marine organisms. Between feeding cycles, they come to shore to rest at isolated resting areas (haulouts) distributed around the Bay. In recent years, the number of walrus using the haulout at Cape Seniavin on the Alaska Peninsula has increased substantially and this haulout has become one of the most important resting areas for walrus in Alaska.

Walrus are sensitive to Human Disturbances. Although responses to human activities are variable, walrus will often flee haulouts in response to the sight, sound, or odor of humans or their machines. Trampling deaths associated with haulout disturbance is one of the largest known sources of natural mortality for walrus. Frequent or prolonged disturbances may even result in long term haulout abandonment.

Disturbing Walrus is against the law. Operating an aircraft or boat in a manner which results in disturbing, harassing, herding, hazing, or driving of walrus is prohibited under provisions of the Marine Mammals Protection Act and Federal Airborne Hunting Act.

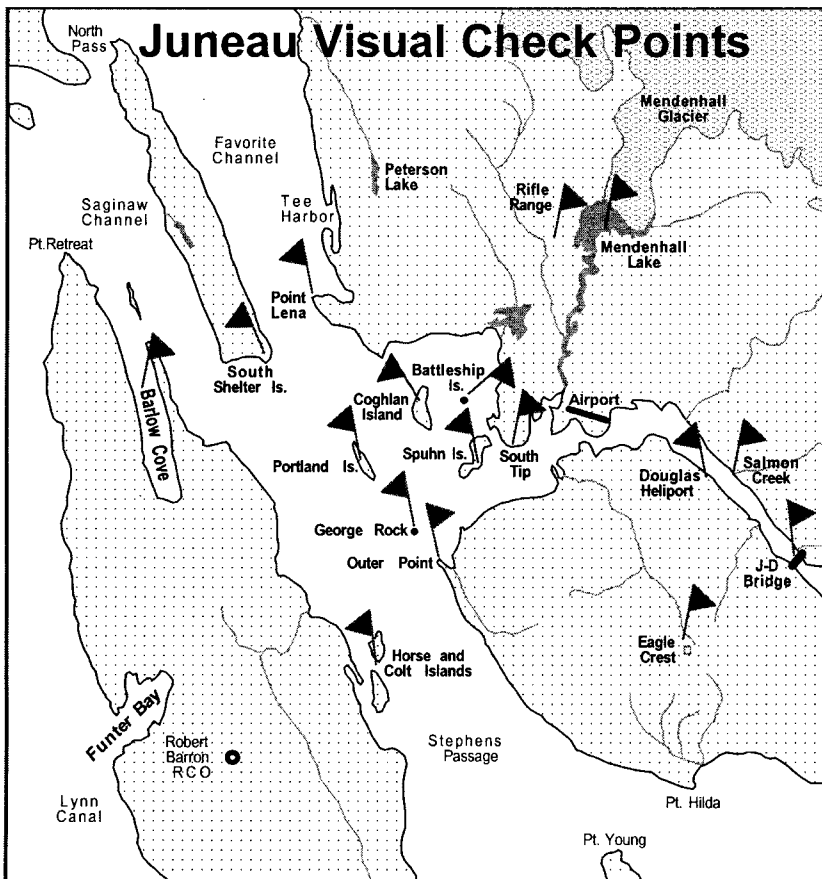

Aviators can help minimize disturbances to Walrus at Cape Seniavin. To ensure that walrus are not disturbed, please follow these guidelines between April 1st and October 31st when traveling near Cape Seniavin:

- + Fixed wing aircraft remain at altitudes greater than 2,000 feet above ground level (AGL) within 1/2 mile of Cape Seniavin (56°24'N, 160°09'W). Helicopters remain at altitudes greater than 5,000 feet AGL within one (1) nautical mile of the Cape. If cloud conditions necessitate flying lower than these recommended altitudes, please pass inland to avoid flushing walrus from the beach.
- + Walrus are particularly sensitive to changes in engine noise and are more likely to stampede off beaches when planes turn or fly low overhead - please avoid circling or turning while in the area of the haulout.
- + Aircraft visiting Cape Seniavin should land well away from the haulout and only taxi as close to the haulout as is necessary for landing and take off. Approaching the haulout by foot will greatly reduce the amount of disturbance to the animals resting at the haulout.
- + Marine vessels are requested to remain at least 1/2 mile from shore when transiting past the Cape.

THANK YOU FOR YOUR HELP AND COOPERATION.

Notes for the Juneau Area

Juneau General Guidelines

1. All aircraft should fly with their lights on at all times.
2. Aircraft should fly to the right side while in the Gastineau Channel.
3. Limit radio communication on frequencies 123.05 & 122.75 to position reports.
4. Traffic southeast bound from Juneau Airport should change frequency prior to crossing the bridge to 123.05 to monitor seaplane traffic in the downtown harbor.
5. Maintain at least 1,500 feet AGL in heavy tour areas to avoid conflicts. Pilots should be familiar with tour routes, reporting points, and announce intentions on published frequencies.
6. Enter drainage's (upstream) at even thousands (1,000, 2,000, 3,000, etc). Exit drainages (downstream) at 500 foot intervals (1,500, 2,500, 3,500, etc).
7. Traffic west bound from Juneau Airport toward Cross Sound / Icy Straits, fly at 500 foot intervals.
8. Above 3,000 feet AGL, maintain the appropriate altitude as specified in the Code of Federal Regulations, 14 CFR Part 91.159, VFR Cruising Altitude or Flight Level.

Juneau Traffic Pattern Altitudes

Aircraft arrival/departure altitudes may vary from these listed:

Helicopters:	500 feet
Fixed wing:	1,000 feet
Turbo-jet:	1,500 feet or above

Juneau Harbor Seaplane Base Standard Procedures

1. Direct questions to US Coast Guard Marine Safety Office in Juneau (907-463-2464), the FAA AFSS (907- 789-6124), or the FAA FSDO (907-586-7532).
2. Follow international navigation rules while operating as a vessel (on the water).
3. No take-offs, landings, nor step taxiing within a cruise ship lightering corridor.
4. Take-offs, landings, or step taxiing only within the boundaries of the take-off and landing corridors. Pilots have the option to use other areas when wind and weather conditions require, but must maintain adequate separation from vessel traffic.
5. Observe right-hand traffic rule in the channel.
6. Pilots are reminded not to fly within 500 feet of any structures, except as necessary for take-off and landing.
7. Take-offs and landings should be made on the outside of the cruise ship due to the tenders transiting between the ship and the dock. Be aware that choppy water can exist due to wakes caused by fishing boat and pleasure boat activity.

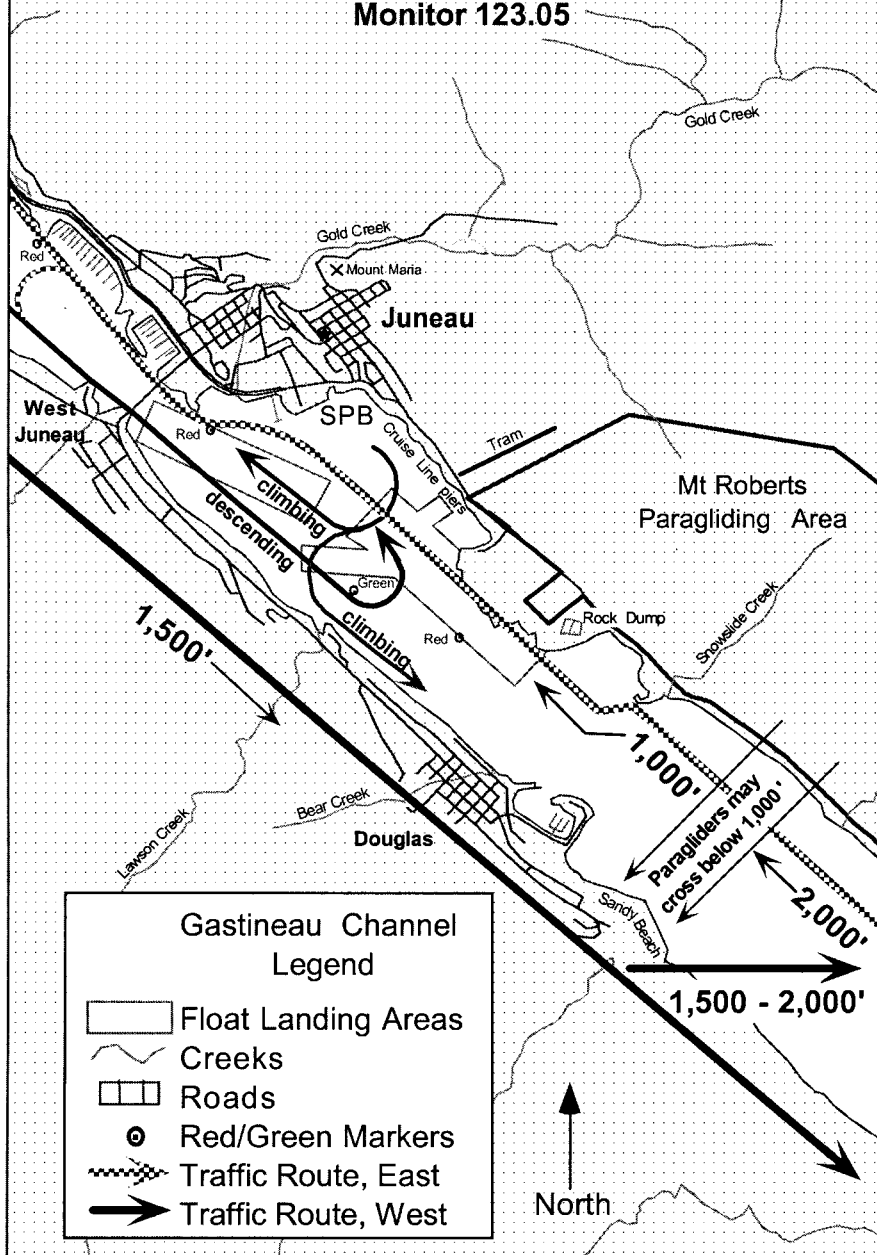

Traffic between Juneau/Haines/Skagway

1. Traffic north bound from Juneau to Haines / Skagway should fly at altitudes of 1,500 or 2,500 MSL and close to the shoreline. Traffic flying up Tiaya Inlet (Haines to Skagway) should fly to the left of the inlet.
2. Traffic south bound from Haines and Skagway should, weather permitting, fly at altitudes of 1,000, 2,000, or 3,000 MSL and further out over the water (within gliding distance of shore). South bound traffic from Skagway thru the Tiaya Inlet should fly to the left of the inlet.
3. Traffic to Haines and Skagway, pilots should give a position report 10 minutes or 15 miles out and when entering the traffic pattern on the published CTAF: Haines – 122.9, Skagway – 122.9.
4. Monitor 122.9 while operating in Lynn Canal.

Internet Website: <http://www.alaska.faa.gov>

Juneau Harbor Seaplane Base Float Plane Procedures

Monitor 123.05

Procedures for Operations at Unalaska Airport

******DANGER****** There is a road crossing the approach of RWY 30. Warning System and Gates must be activated. The gates are controlled by Pilot Controlled Lighting (PCL) on frequency 122.6 (CTAF). This frequency controls the REILS, MIRLS, and the gates.

TWO WAY RADIO COMMUNICATIONS ARE STRONGLY RECOMMENDED FOR ALL AIRCRAFT OPERATING AT UNALASKA AIRPORT.

For all departures and arrivals the pilot can turn on the runway lighting with 7 'clicks' on the microphone on frequency 122.6. This action will 1) Turn on the flashing red stop lights on either side of the runway 30 approach, 2) Turn on the MIRLS at high level, 3) Activate the REILS, and 4) Lower the three gates depicted on the adjoining graphic. **Warning:** Once the system is on, 3 'clicks' on the microphone will deactivate it. So, do not lower the intensity of the runway lights, unless safety of flight dictates.

****If the REILS are not flashing, the gates and warning system are not active.****

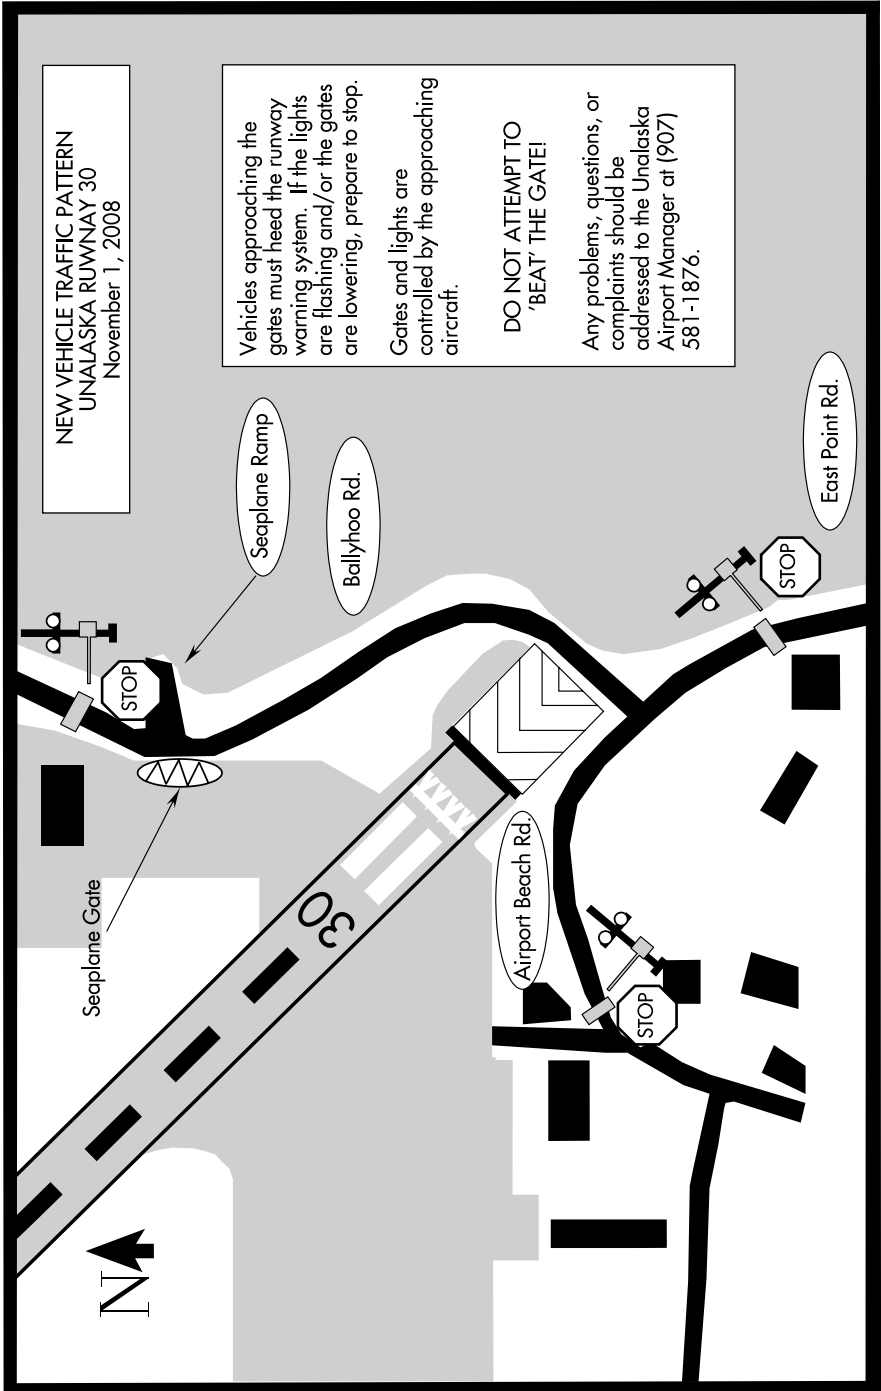

Prior to arrival, pilots are recommended to contact a company that performs ground handling operations at the airport. When the service is available, these companies will have a 'Mobile One' operator designated to physically place a vehicle and driver with an aircraft radio close to the approach end of RWY 30. 'Mobile One' will monitor CTAF and advise the aircraft that the gates have lowered, that there are no vehicles on the road inside the gates, and that it is safe to land.

Once you land or depart, please turn off the REILS and open the gates by 3 'clicks' of the mic on 122.6. Using 3 'clicks' on the microphone will deactivate the warning system.

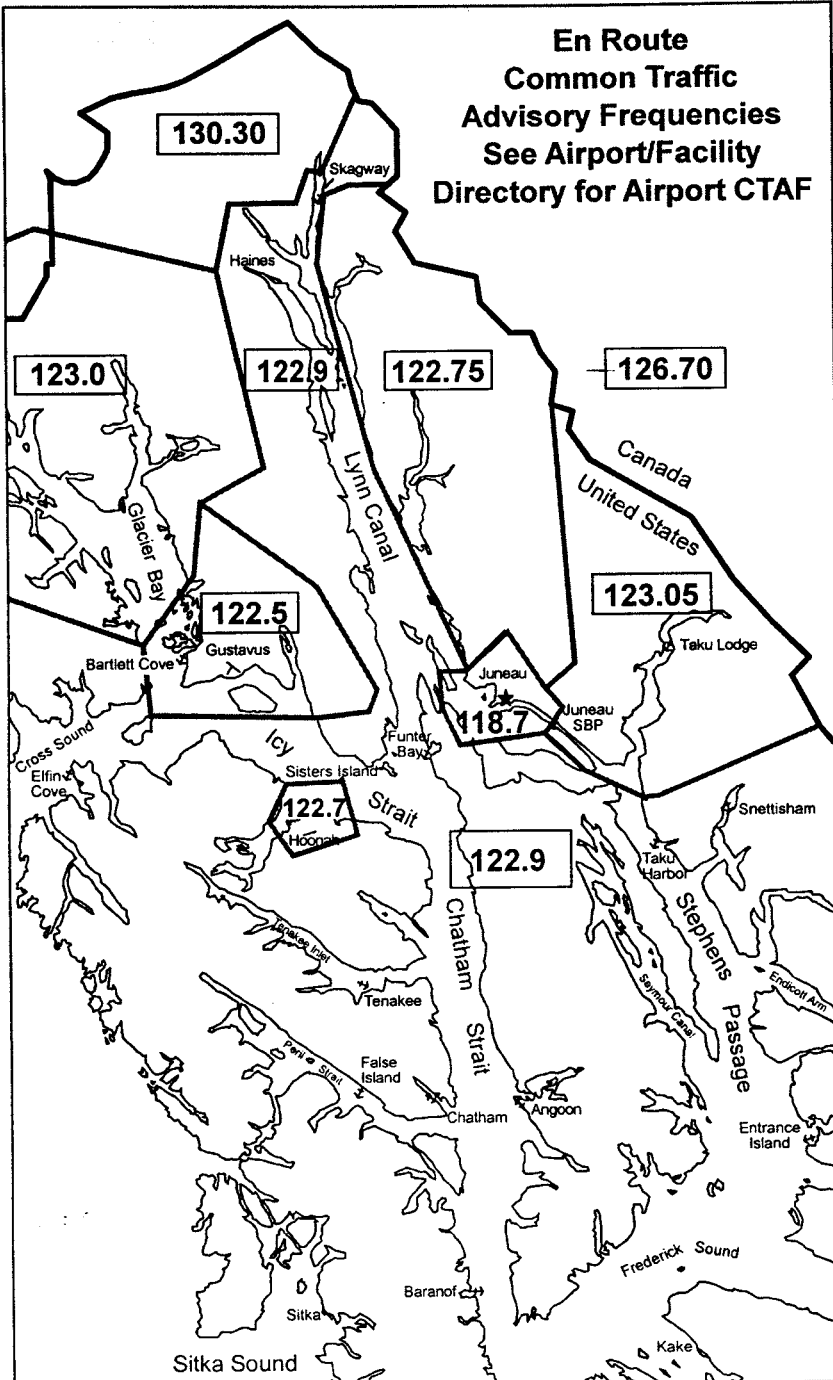

WARNING: If vehicular traffic is on the road at the approach end of RWY 30, flying the VASI does NOT ensure vehicle clearance as you pass over the road.

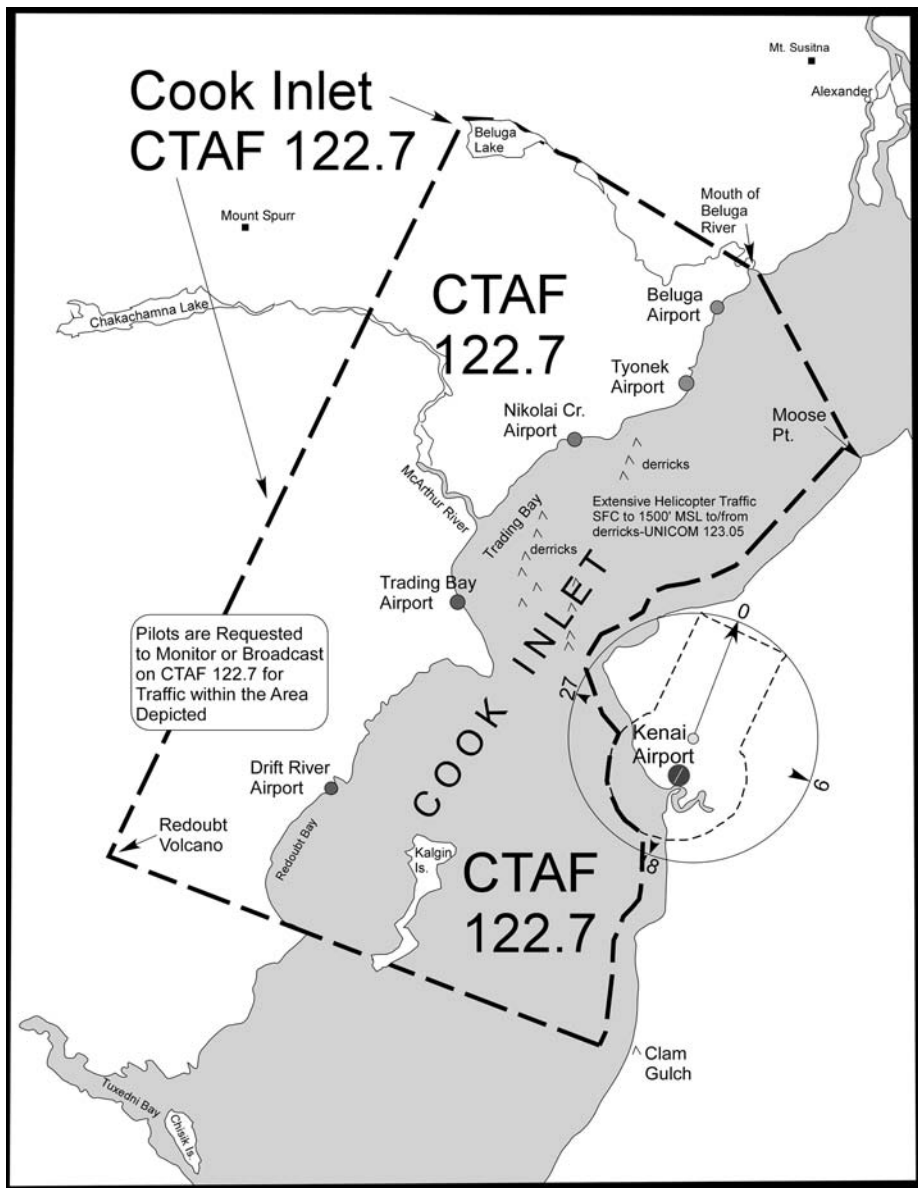

Comments about these operations may be directed to:

Unalaska Airport Manager
P.O. Box 920565
Dutch Harbor, AK 99692
(907) 581-1786

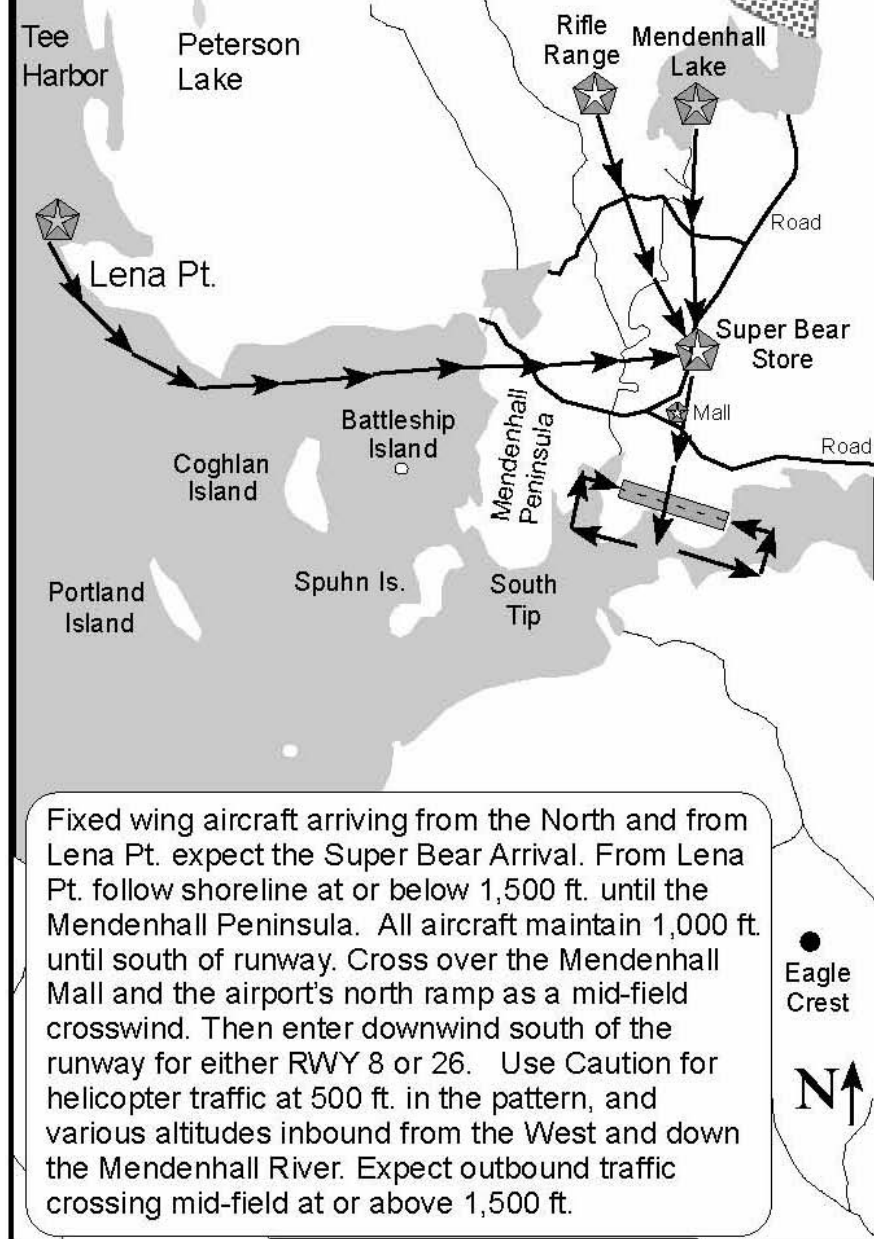

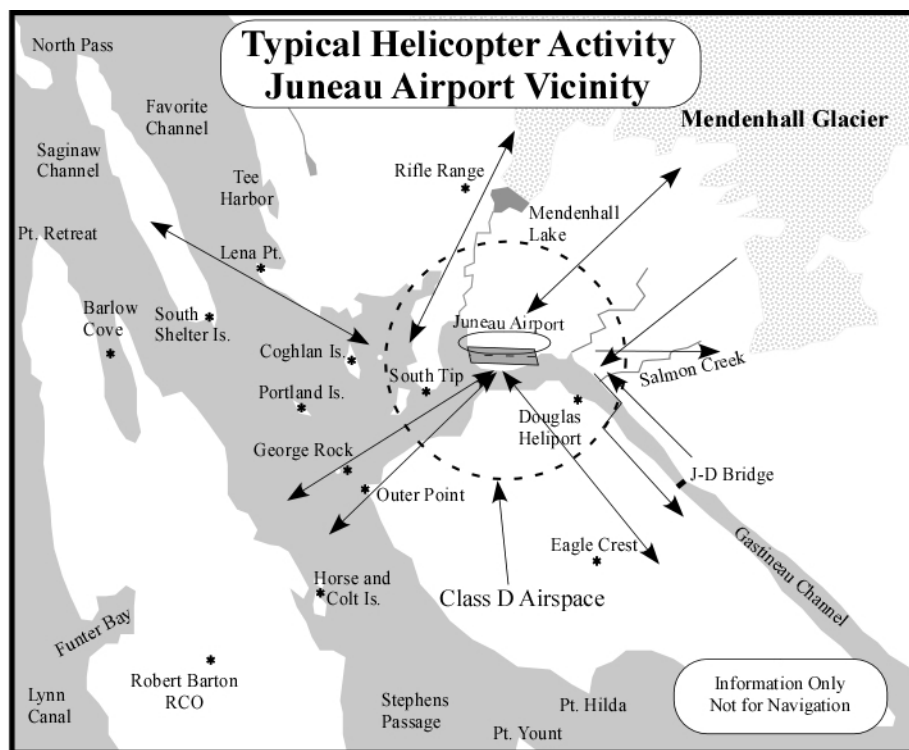

**En Route
Common Traffic
Advisory Frequencies
See Airport/Facility
Directory for Airport CTAF**

Super Bear Arrival Juneau Airport

This graphic depicts typical VFR helicopter routing in the Juneau area. Helicopters use a traffic pattern just north of the runway. Use caution, high intensity flight activity occurs during the summer months. Flights of multiple helicopters in trail are common. See other pages in this section for additional Juneau information.

Standard North Slope Oilfield Aviation Operations

1. Monitor the appropriate Common Traffic Advisory Frequency at or below 2,000 feet for receiving and transmitting concise traffic advisories. Operational messages should be kept to a bare minimum or else transmitted on another frequency. CTAF for Kuparuk-Alpine- Nuiqsut is 122.8; 122.85 for Prudhoe-West Dock-North Star Corridor; 122.9 for Badami and Kavik.
2. Make position reports within five (5) miles of Kuparuk, Alpine, North Star, and West Dock Helipad.
3. Position reports should include azimuth, distance from an identified location, altitude, and direction of flight.
4. All aircraft, including helicopters, will operate with landing lights on, when at or below 2,000 feet.
5. Helicopters arriving and departing Kuparuk and Alpine will avoid the approach ends of runways by transiting the airport area via an arrival or departure fix as depicted on the North Slope graphics.
6. Fixed-wing aircraft flying the Kuparuk -Alpine corridor will fly offset one and a half (1½) miles to the right of center line until five (5) miles from destination then enter the pattern.
7. Helicopters flying the Kuparuk-Alpine corridor will fly one half mile (1½) offset right of center line until five miles from destination then proceed to helicopter arrival gate and then to the pad so as to avoid the final approach extended centerline of the runway.
8. On departure from Kuparuk or Alpine, announce route and altitude.
9. Aircraft with transponders will operate with them turned on.
10. Avoid overflight of the Helmrick homestead (N 70° 25' 56" W 150° 23' 19" NAD 83).
11. Contracted air service companies will insure that all crew members dispatched to the North Slope are briefed on these procedures.
12. Other operators in the area will be informed of our procedures and encouraged to participate for our mutual safety.

True
North

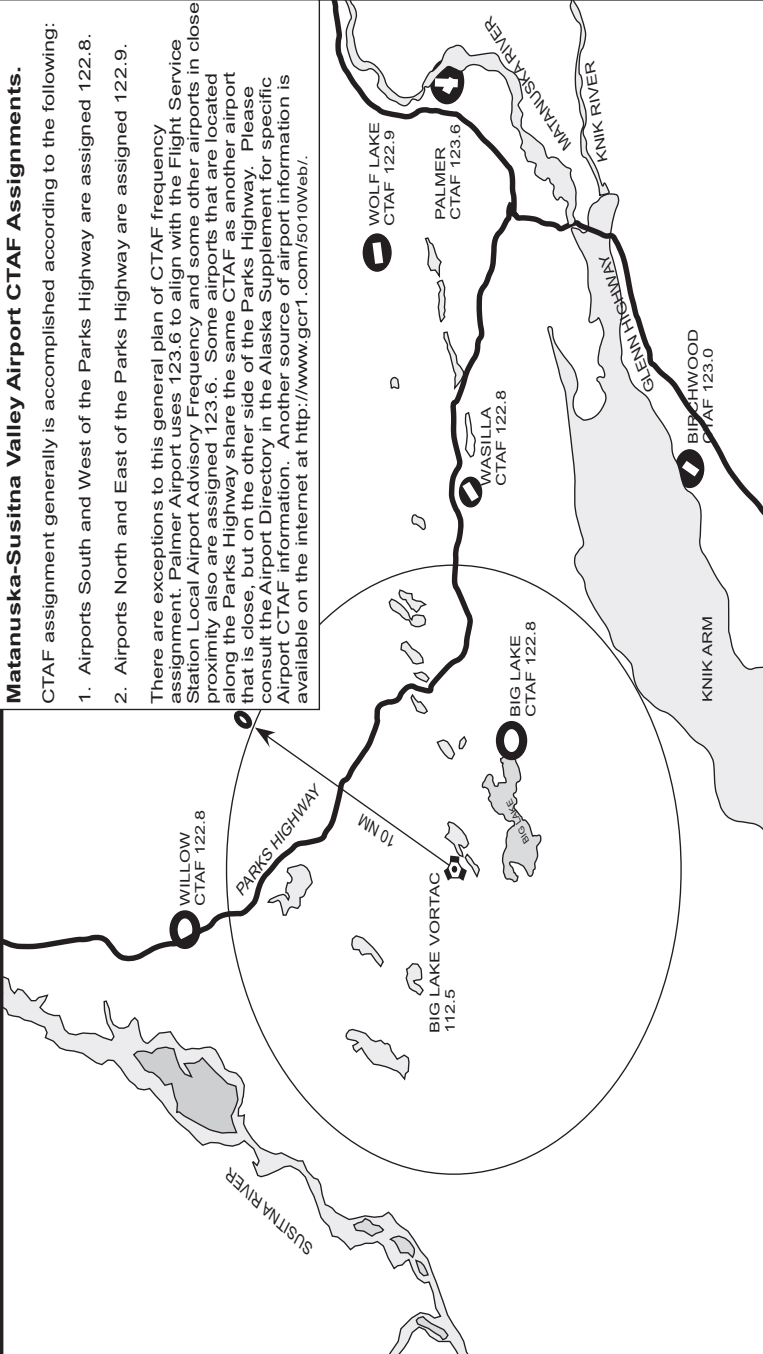

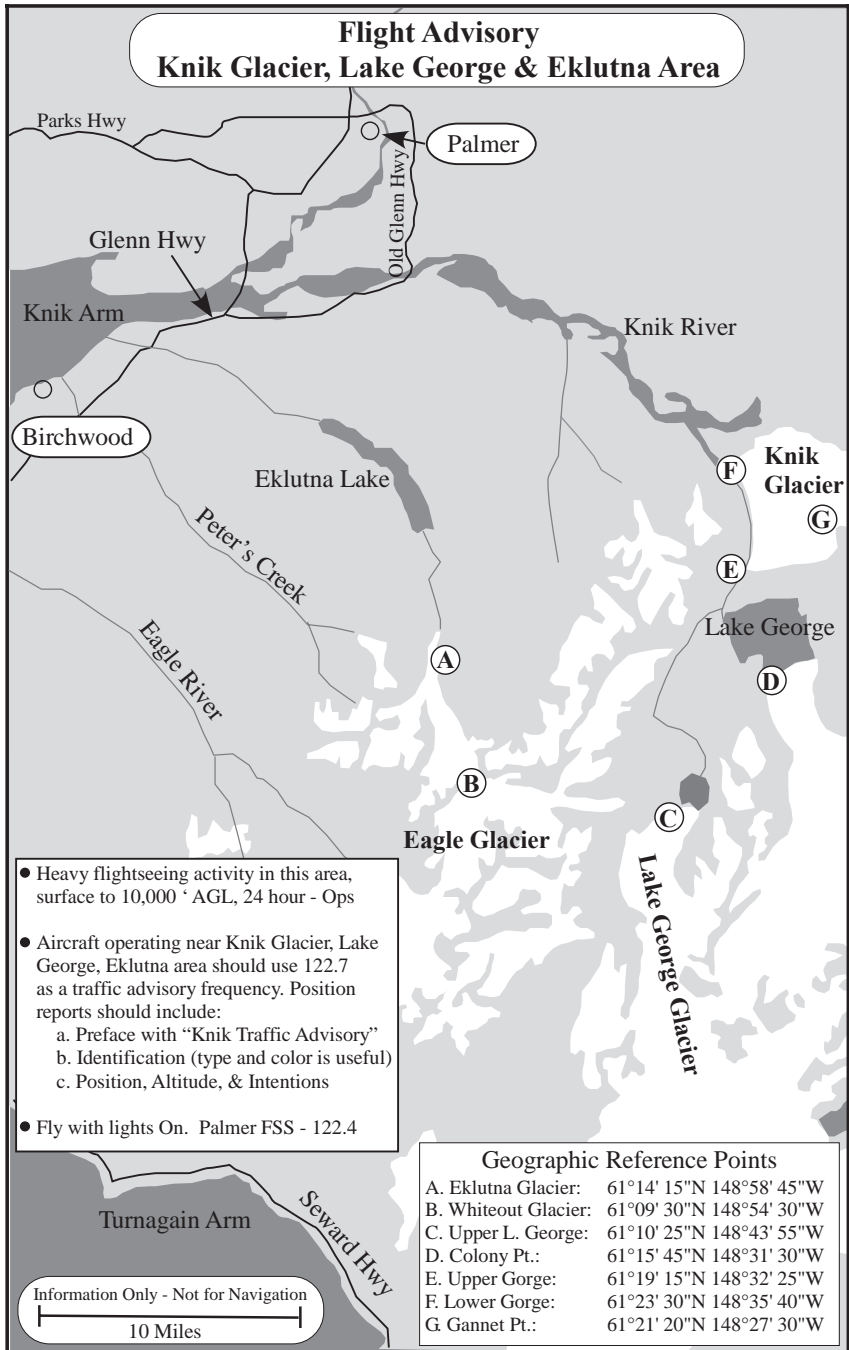

Matanuska-Susitna Valley Airport CTAF Assignments.

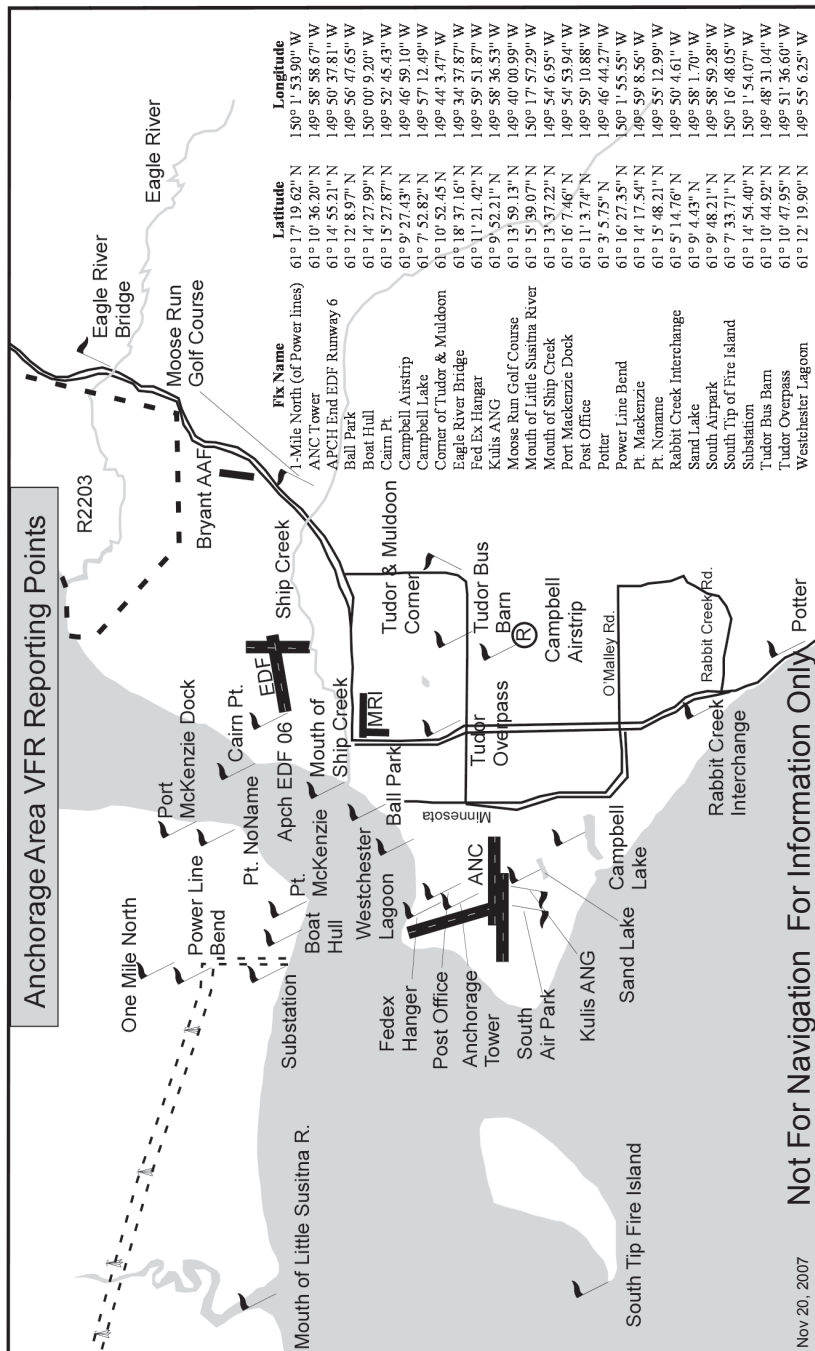

CTAF assignment generally is accomplished according to the following:

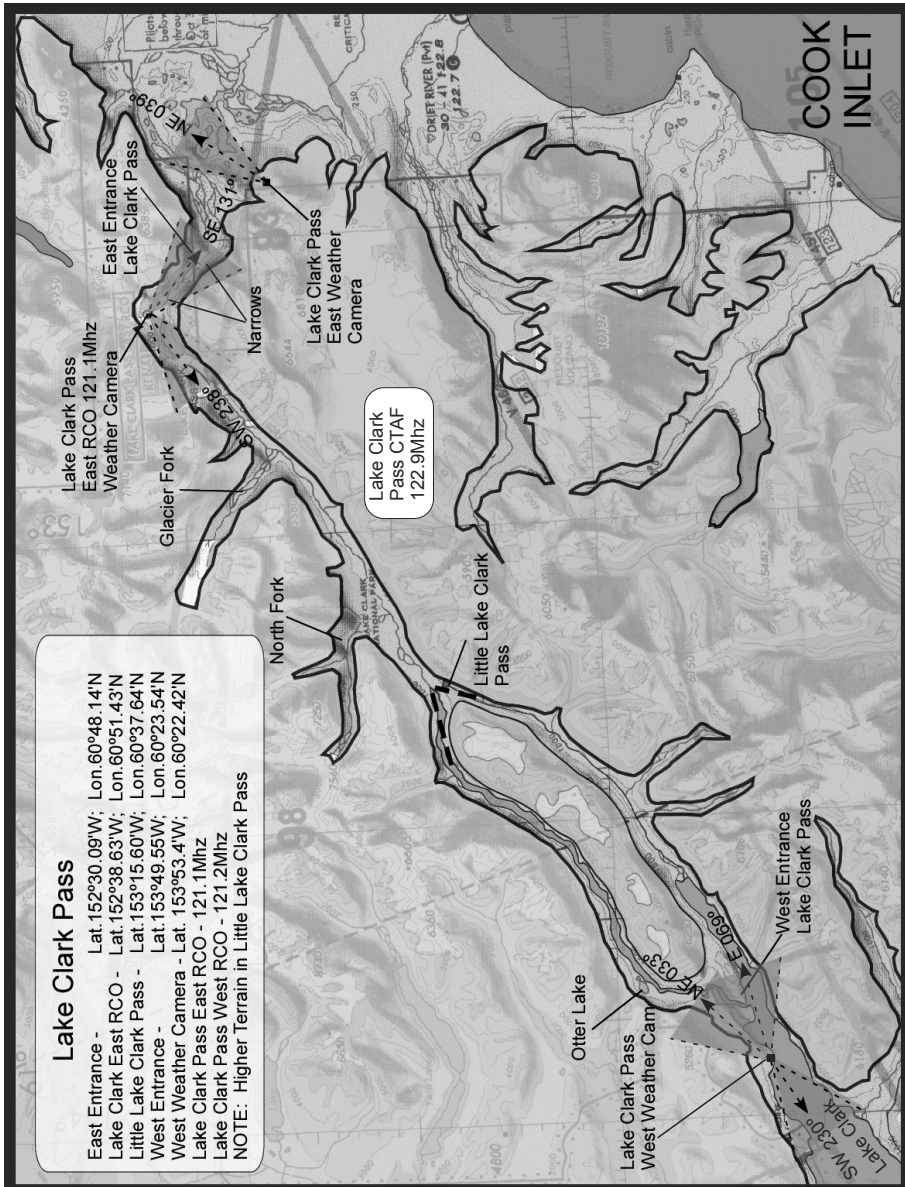

1. Airports South and West of the Parks Highway are assigned 122.8.
2. Airports North and East of the Parks Highway are assigned 122.9.

There are exceptions to this general plan of CTAF frequency assignment. Palmer Airport uses 123.6 to align with the Flight Service Station Local Airport Advisory Frequency and some other airports in close proximity also are assigned 123.6. Some airports that are located along the Parks Highway share the same CTAF as another airport that is close, but on the other side of the Parks Highway. Please consult the Airport Directory in the Alaska Supplement for specific Airport CTAF information. Another source of airport information is available on the internet at <http://www.gcr1.com/5010Web/>.

REGULATORY NOTICES

KETCHIKAN INTERNATIONAL AIRPORT

SPECIAL AIR TRAFFIC RULES AND AIRPORT TRAFFIC PATTERNS (14 CFR Part 93)

Airspace

Special air traffic rules and communication requirements are in effect for person operating aircraft under Visual Flight Rules (VFR), to, from, or in the vicinity of the Ketchikan International Airport or Ketchikan Harbor. These procedures are in effect below 3,000 feet MSL with the perimeter defined as the Ketchikan Class E surface area regardless of whether the Class E surface area is in effect.

Communications

When the Ketchikan Flight Service Station (FSS) is in operation, no person may operate an aircraft within the airspace specified above, or taxi onto the runway at Ketchikan International Airport, unless that person has established two-way radio communications with the Ketchikan FSS for the purpose of receiving traffic advisories and continues to monitor the advisory frequency at all times while operating within the specified airspace.

When the Ketchikan FSS is not in operation, each pilot must continuously monitor and communicate, as appropriate, on the designated common traffic advisory frequency (CTAF) as follows:

For inbound flights. Announce position and intentions when no less than 10 miles from Ketchikan International Airport, and monitors the designated frequency until clear of the movement area on the airport or Ketchikan Harbor.

For departing flights. Announce position and intentions prior to taxiing onto the active runway on the airport or onto the movement area of Ketchikan Harbor and monitors the designated frequency until outside the airspace described above, and announce position and intentions upon departing that airspace.

If two-way radio communications failure occurs in flight, a person may operate the aircraft to a landing.

Aircraft Operation

When a pilot receives an advisory from the Ketchikan FSS that an aircraft is on final approach to the Ketchikan International Airport, that pilot must remain clear of the runway until the approaching aircraft has landed and has cleared the runway. Unless otherwise authorized by ATC, each person operating a large airplane or a turbine engine powered airplane shall—(1) When approaching to land at the Ketchikan International Airport, maintain an altitude of at least 900 feet MSL until within three miles of the airport; and (2) After takeoff from the International Airport, maintain runway heading until reaching an altitude of 900 feet MSL.

Recommended VFR Arrival and Departure Procedures and Traffic Patterns

Aircraft normally arrive and depart the Ketchikan Class E airspace via the Tongass Narrows. This results in aircraft passing very close in an area with very little maneuvering room. In response to the higher-than-normal risks and to ensure an acceptable margin of aviation safety, special VFR arrival and departure procedures/patterns for floatplanes, helicopters, and single-engine wheeled aircraft are in use for all VFR operations in the Ketchikan and Tongass narrows area. Copies of these procedures and patterns can be obtained from: Ketchikan FSS, 1800 Airport Terminal Building, Ketchikan, AK 99901; Juneau AFSS, 9230 Cessna Drive, Juneau, AK 99801, or Sitka FSS, 800 Airport Road, Sitka, AK 99835.

The recommended pattern in use at the Ketchikan Harbor and Airport will be broadcast on the Ketchikan ATIS, 134.45 MHz. If the ATIS is out of service, Ketchikan FSS will provide recommended pattern information on 123.6 MHz.

The Ketchikan Visual Checkpoint Table below is in NAD 83 (formatted in degrees, minutes, seconds) and is to be used with the picture on the next page. Alaskan Region FAA Internet Website located at: <http://www.alaska.faa.gov/at>

ALASKA WEATHER CAMERA LOCATIONS

FAA aviation weather cameras are installed throughout the state of Alaska. Images are designated as an FAA supplementary weather product used for enhanced situational awareness. Cameras provide images of sky conditions at or near airports and strategic en route locations via the internet at: <http://akweathercams.faa.gov>. Images are normally updated every ten minutes to provide near real-time conditions. Images are also stored for viewing historic conditions. FAA aviation weather camera images should be used in conjunction with other primary weather products, flight service briefings, and in-flight visual observations. You are also encouraged to contact the local flight service station for camera image updates while airborne.

FAA aviation weather cameras are also depicted on aeronautical charts. Following is a list of all operational aviation weather camera locations. The camera site name is depicted in bold type and correlates to the FAA aviation weather camera website (<http://akweathercams.faa.gov>). The airports and facilities that the cameras services is depicted in light type.

FAA HF/SSB AIR-GROUND COMMUNICATIONS STATIONS

The FAA maintains a domestic HF/SSB air-ground communications network to provide FSS services to aircraft anywhere in Alaska. Flight Service Stations at Barrow, Kotzebue, Cold Bay, and Ketchikan are equipped with HF/SSB/AM radio equipment operating on frequencies 2866 KHz and 5631 KHz. These four FSSs operate as an area-wide HF "net" and are prepared to provide communications to any aircraft in Alaska. Pilots are encouraged to call the nearest HF/SSB air-ground communications station; however, due to propagation characteristics, the nearest HF/SSB station may not necessarily read your transmission; i.e., Ketchikan FSS may read an aircraft in the Bristol Bay area when Cold Bay cannot, and vice versa.

Most services normally provided by FSSs are available on HF frequencies, i.e., weather, filing or closing flight plans, pilot briefing, search and rescue, etc.

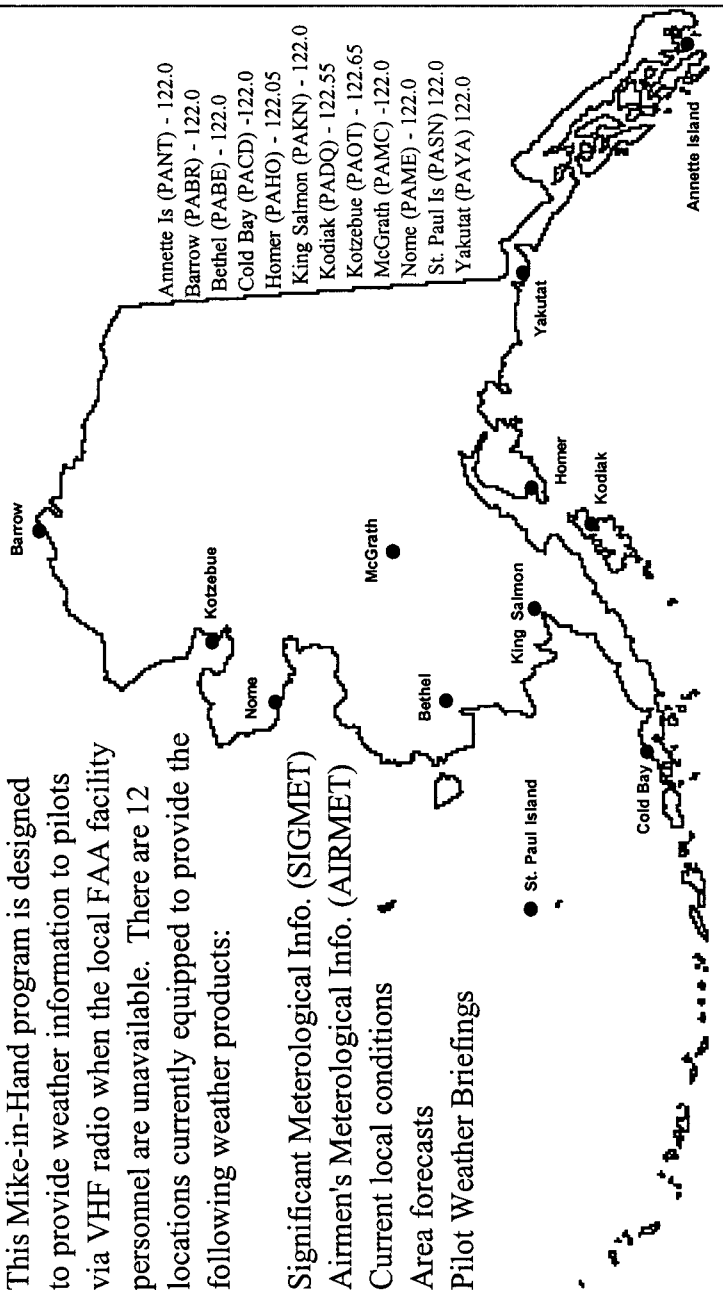

METEOROLOGICAL INFORMATION (HF-VOLMET)

National Weather Service Mike-in-Hand Program

This Mike-in-Hand program is designed to provide weather information to pilots via VHF radio when the local FAA facility personnel are unavailable. There are 12 locations currently equipped to provide the following weather products:

Significant Meteorological Info. (SIGMET)
 Airmen's Meteorological Info. (AIRMET)
 Current local conditions
 Area forecasts
 Pilot Weather Briefings

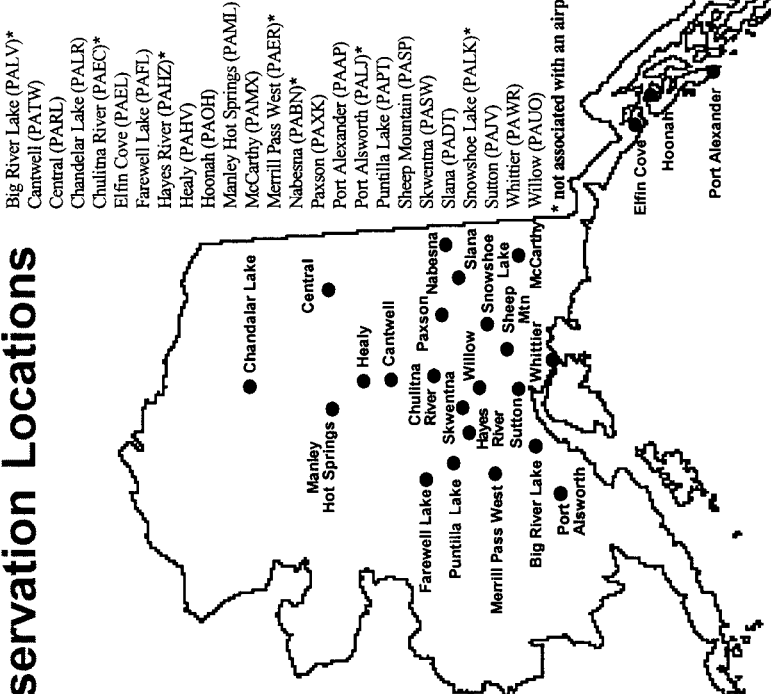

A-PAID Weather Observation Locations

An A -Paid Observer is a person certified by the National Weather Service (NWS) to provide weather information under the terms of a "per-observation" agreement. The NWS initiated this program to assist them in developing and validating forecasts.

Although the service does not meet the requirements for a basic weather watch, the FAA does provide the telecommunications capability necessary to make the information available to pilots though the nearest Flight Service Station.

There are currently 25 A -Paid locations, 5 of which are funded by the FAA. When available, the observers provide hourly weather per a set schedule that ranges generally from six (6) to 15 observations a day. No special observations are performed and the hourly reports may be intermittent. A -Paid observations are performed at the following locations. For more information, contact the NWS at (907) 271-5116.

Forecast	Explanation	Report
TAF	Message type: <u>TAF</u> -routine or <u>TAF AMD</u> -amended forecast, <u>METAR</u> -hourly, <u>SPECI</u> -special or <u>TESTM</u> -non-commissioned ASOS report	METAR
KPIT	ICAO location indicator	KPIT
091730Z	Issuance time: ALL times in UTC " <u>Z</u> ", 2-digit date, 4-digit time	091955Z
091818	Valid period: 2-digit date, 2-digit beginning, 2-digit ending times	
	In U.S. METAR : <u>COR</u> rected ob; or <u>AUTO</u> mated ob for automated report with no human intervention; omitted when observer logs on	COR
15005KT	Wind: 3 digit true-north direction, nearest 10 degrees (or <u>VaRiAbLe</u>); next 2-3 digits for speed and unit, <u>KT</u> (KMH or MPS); as needed, <u>Gust</u> and maximum speed; 00000KT for calm; for METAR , if direction varies 60 degrees or more, <u>Variability</u> appended, e.g. 180V260	22015G25KT
5SM	Prevailing visibility: in U.S., <u>Statute Miles</u> & fractions; above 6 miles in TAF <u>Plus6SM</u> . (Or, 4-digit minimum visibility in meters and as required, lowest value with direction)	3/4SM
	Runway Visual Range: <u>R</u> ; 2-digit runway designator <u>Left</u> , <u>Center</u> , or <u>Right</u> as needed; <u>"</u> / <u>"</u> ; <u>Minus</u> or <u>Plus</u> in U.S., 4-digit value, <u>FeeT</u> in U.S., (usually meters elsewhere); 4-digit value <u>Variability</u> 4-digit value (and tendency <u>Down</u> , <u>Up</u> or <u>No</u> change)	R28L/2600FT
HZ	Significant present, forecast and recent weather: see table (on back)	TSRA
FEW020	Cloud amount, height and type: <u>SKy</u> <u>CleaR</u> 0/8, <u>FEW</u> >0/8-2/8, <u>SCaTtered</u> 3/8-4/8, <u>BroKeN</u> 5/8-7/8, <u>OverCast</u> 8/8; 3-digit height in hundreds of ft; <u>Towering CUmulus</u> or <u>CumulonimBus</u> in METAR ; in TAF , only <u>CB</u> . <u>Vertical Visibility</u> for obscured sky and height "VV004". More than 1 layer may be reported or forecast. In automated METAR reports only, <u>CLeaR</u> for "clear below 12,000 feet"	OVC010CB
	Temperature: degrees Celsius; first 2 digits, temperature <u>"</u> / <u>"</u> last 2 digits, dew-point temperature; <u>Minus</u> for below zero, e.g., M06	18/16
	Altimeter setting: indicator and 4 digits; in U.S., <u>A-inches</u> and hundredths; (<u>Q</u> -hectoPascals, e.g., Q1013)	A2992

KEY to AERODROME FORECAST (TAF) and AVIATION ROUTINE WEATHER REPORT (METAR)

Forecast	Explanation	Report
WS010/31022KT	In U.S. TAF , non-convective low-level ($\leq 2,000$ ft) <u>Wind Shear</u> ; 3-digit height (hundreds of ft); <u>"T"</u> ; 3-digit wind direction and 2-3 digit wind speed above the indicated height, and unit, <u>KT</u> In METAR , <u>ReMark</u> indicator & remarks. For example: <u>Sea-Level</u> Pressure in hectoPascals & tenths, as shown: 1004.5 hPa; <u>Temp</u> /dew-point in tenths °C, as shown: temp. 18.2°C, dew-point 15.9°C	RMK SLP045 T01820159
FM1930	<u>FroM</u> and 2-digit hour and 2-digit minute beginning time: indicates significant change. Each FM starts on new line, indented 5 spaces.	
TEMPO 2022	<u>TEMPO</u> rary: changes expected for < 1 hour and in total, < half of 2-digit hour beginning and 2-digit hour ending time period	
PROB40 0407	<u>PROB</u> ability and 2-digit percent (30 or 40): probable condition during 2-digit hour beginning and 2-digit hour ending time period	
BECMG 1315	<u>BECOM</u> ing: change expected during 2-digit hour beginning and 2-digit hour ending time period	

Table of Significant Present, Forecast and Recent Weather - Grouped in categories and used in the order listed below; or as needed in TAF, No Significant Weather.

QUALIFIER

Intensity or Proximity

- Light "no sign" Moderate + Heavy

VC Vicinity: but not at aerodrome; in U.S. **METAR**, between 5 and 10SM of the point(s) of observation; in U.S. **TAF**, 5 to 10SM from center of runway complex (elsewhere within 8000m)

Descriptor

MI Shallow	BC Patches	PR Partial	TS Thunderstorm
BL Blowing	SH Showers	DR Drifting	FZ Freezing

WEATHER PHENOMENA

Precipitation

DZ Drizzle	RA Rain	SN Snow	SG Snow grains
IC Ice crystals	PL Ice pellets	GR Hail	GS Small hail/snow pellets

UP Unknown precipitation in automated observations

Obscuration

BR Mist ($\geq 5/8$ SM)	FG Fog ($< 5/8$ SM)	FU Smoke	VA Volcanic ash
SA Sand	HZ Haze	PY Spray	DU Widespread dust

Other

SQ Squall	SS Sandstorm	DS Duststorm	PO Well developed dust/sand whirls
FC Funnel cloud	+FC tornado/waterspout		

- Explanations in parentheses "()" indicate different worldwide practices.
- Ceiling is not specified; defined as the lowest broken or overcast layer, or the vertical visibility.
- NWS **TAFs** exclude turbulence, icing & temperature forecasts; NWS **METARs** exclude trend fcsts
- Although not used in US, Ceiling And Visibility OK replaces visibility, weather and clouds if: visibility ≥ 10 km; no cloud below 5000 ft (1500 m) or below the highest minimum sector altitude, whichever is greater and no CB; and no precipitation, TS, DS, SS, MIFG, DRDU, DRSA or DRSN.

MARINE RADIO BEACONS

For station identification simple characteristics consisting of combinations of dots and dashes are used. These combinations and the lengths of the dots, dashes and spaces are chosen for ease of identification. The combinations are not transmitted as morse code and are not referred to as such, but as: (—); (— ·); etc., depending on the combination used. All radiobeacons superimpose the characteristic on a carrier which is on continuously during the period of transmission. This extends the usefulness of marine radiobeacons to aircraft employing automatic radio direction finders.

PARACHUTE JUMPING AREAS

The following tabulation lists all known Parachute Jump sites in Alaska. Unless otherwise indicated, all activities are conducted during daylight hours and under VFR conditions. NOTAM D's may be issued to advise users of specific dates and times if outside the times/altitudes that are published.

Anchorage	037° radial 21 NM ANCHORAGE VOR/DME to 12,500' Weekends.
Anchorage/Campbell	062° radial 12 NM ANCHORAGE VOR/DME to 2,000' Unscheduled.
Anchorage/Claxton	044° radial 17 NM ANCHORAGE VOR/DME to 12,500'.
Anchorage/Girdwood	084° radial 34 NM ANCHORAGE VOR/DME to 12,500'. Fri-Sun. SR-SS daily. NM radius.
Anchorage/Malemute	028° radial 20 NM ANCHORAGE VOR/DME to 5,000' weekdays. Military use only.
Fairbanks/Birch Hill	042° radial 10 NM FAIRBANKS VORTAC to 6000' Apr 1-Oct 31 SR-SS. 3 NM radius.
Fairbanks/Chena Lake Flood Plain	061° radial 22 NM FAIRBANKS VORTAC to 5000' Apr 1-Oct 31 SR-SS. 5 NM radius.
Fairbanks/Dead Moose/Tallgrass	046° radial 12 NM FAIRBANKS VORTAC to 5,000'. Unscheduled.
Fairbanks/Farmer Brown	042° radial 14 NM FAIRBANKS VORTAC to 6000' Apr 1-Oct 31 SR-SS. 3 NM radius.
Fairbanks/Firebird	079° radial 36 NM FAIRBANKS VORTAC to 3,000'. Unscheduled.
Fairbanks/Husky	067° radial 27 NM FAIRBANKS VORTAC to 3,500'. Military use only. Continuous.
Fairbanks/Leslie's Field	039° radial 13 NM FAIRBANKS VORTAC to 5000' Unscheduled.
Fairbanks/Grizz Pond	045° radial 13 NM FAIRBANKS VORTAC to 5000' Apr 1-Oct 31 SR-SS. 5 NM radius.
Fairbanks/Nordale Jumpspot	055° radial 15 NM FAIRBANKS VORTAC to 5000' Apr 1-Oct 31 SR-SS. 5 NM radius.
Fairbanks/Paintball	061° radial 18 NM FAIRBANKS VORTAC to 5,000'. Apr 1-Oct 31 SR-SS. 5 NM radius.
Fairbanks/River Road	046° radial 11 NM FAIRBANKS VORTAC to 6000' Apr 1-Oct 31 SR-SS 3 NM radius.

Tok Junction	101.5 MHz	300W	63°19'N 142°48'W

Note: All stations listed above repeat broadcasts originating from studios at Elmendorf AFB with the exception of Adak which is a Navy broadcasting facility. All transmitters are on the air 24 hours a day.

VOR RECEIVER CHECKPOINTS

Airborne and ground checkpoints consist of certified radials that should be received at specific points on the airport surface, or over specific landmarks while airborne in the immediate vicinity of the airport.

Should an error in excess of $\pm 4^\circ$ be indicated through use of the ground check, or $\pm 6^\circ$ using the airborne check, IFR flight should not be attempted without first correcting the source of the error.

CAUTION: No correction other than the "correction card" figures supplied by the manufacturer should be applied in making these VOR receiver checks.

AIRBORNE RECEIVER CHECKPOINTS

Station	Radial	Distance	Location
Barrow	018°	9.1 NM	Tower on Pt Barrow Promontory 1100' MSL
Bellingham	159°	5.5 NM	Over Nooksack River/15 bridge 1700' MSL
Bethel	063°	11.4 NM	Over apch end of Rwy 06 old Kwethluk strip 1000' MSL.

AUTOMATED FLIGHT SERVICE STATIONS (AFSS) FLIGHT SERVICE STATIONS (FSS) AND SPECIAL REPORTING SERVICE

This "Special Reporting" will provide for air/ground reporting on a prearranged schedule, whenever a pilot is planning a flight over any large body of water, swamp (wetlands), or mountainous terrain.

1. Contact time intervals and/or geographical locations should be agreed upon by the pilot and the AFSS or FSS. Ten minute time intervals are desirable, but due to the uncertain terrain, may not always be possible.
2. If contact is lost for more than 15 minutes, or other agreed upon time interval, Search and Rescue will be initiated.
3. Arrangements for this service can be made during preflight briefing or while in flight.
4. A flight plan is desirable but not mandatory.
5. Air/ground communications capabilities must be evaluated for each request for service.

MILITARY TRAINING ROUTES

The DOD Flight Information Publication AP/1B provides textual and graphic descriptions and operating instructions for all military training routes (IR, VR, SR) and refueling tracks/anchors. Complete and more comprehensive information relative to policy and procedures for IRs and VRs is published in FAA Handbook 7610.4 (Special Military Operations) which is agreed to by the DOD and therefore directive for all military flight operations. The AP/1B is the official source of route data for military users.

Special Use Airspace Information Service (SUAIS)

SUAIS is a system operated by the United States Air Force (USAF) under agreement with the Federal Aviation Administration (FAA) Alaskan Region to assist pilots with flight planning and situational awareness while operating in or near certain Military Operations Areas (MOA) and Restricted Areas in interior Alaska. SUAIS provides a means for civil and USAF pilots to obtain "near real-time" flight information regarding military training flight activity. Service primarily covers the area east of Fairbanks and near Delta Junction in Yukon 1, 2 & 3 MOAs, and in the Birch, Buffalo and Eielson MOAs. Additionally, the USAF provides service to anyone within radio range operating near or within R2202, R2205, R2211, and the military training routes (MTR) in this geographic area (see other MTR page in this section for more information).

SUAIS is available 24 hours a day. Direct communication with Eielson Range Control (ERC) personnel is available whenever USAF aircraft are operating in active MOAs or Restricted Areas. This 10 hour window varies between 0700-2200 local and information regarding daily activation times is available in advance by contacting the 353rd Combat Training Squadron (CTS) Joint Scheduling Office (JSO), (907) 377-2104/3005.

Recorded information regarding airspace activation is provided when ERC personnel are not on duty. SUAIS is available to pilots by telephone at 1 800 758-8723. It is also available on selected UHF frequencies and on VHF 125.3 Mhz. Recorded messages (when ERC is not open) are available by both phone and VHF 125.3.

ERC does not have FAA authority to provide Air Traffic Control (ATC) services SUAIS is limited to information regarding the airspace activity status and the exchange of information on the approximate position of known civil and military aircraft. ERC has radar sites located near Donnelly Dome and the east side of R2205. These sites provide radar coverage from Fairbanks to south of Delta Junction in the areas of the Alaska and Richardson Highways. However, The ability to see small aircraft without transponders is limited.

The service is provided as a supplement, and is not intended to replace ATC services provided by the FAA. Detailed information may be obtained from the USAF internet site hosted by the 611 Air Operations Center at:

<http://www.elmendorf.af.mil/11af/alaskaairspaceinfo/index.asp> Pilots should contact the nearest Flight Service Station for the latest NOTAM information concerning SUA and MTR use. Comments regarding this service may be directed to :

Western Special Use Airspace Military Operations Areas

MILITARY REFUELING TRACKS/ANCHORS

The conduct of aerial refueling is based on the strict requirement that participating aircraft remain within specifically designated airspace. Air refueling operations are normally conducted on tracks or in anchor areas. There are certain mission requirements and operational considerations which may necessitate enroute refueling operations or the establishment of special tracks/anchors not published in this section. Refer to FAA 7610.4 for additional information on those requirements.

Aerial refueling operations will be conducted under instrument flight rules on the Aerial Refueling Tracks/Anchors described in this section. New refueling tracks/anchors or changes to existing refueling tracks/anchors will become effective on the date of this publication unless indicated otherwise.

The tanker aircraft is responsible for requesting altitude clearance and routing (if different than flight plan routing) for the receiver and tanker aircraft beyond the aerial refueling exit point. Throughout the refueling operation, controller initiated heading assignments may not be effected without the concurrence of the tanker. Each aircraft must receive a specific clearance prior to leaving the refueling track/anchor. In the event of no clearance, the tanker(s) and receiver(s) will continue on the tanker's filed route and assigned block altitudes until a clearance to separate the flight can be obtained, or the aircraft will request an extension of the aerial refueling track.

NOTE: Aerial refueling operations are terminated at the end of the refueling point unless an extension of the aerial refueling track is received.

EXPLANATION OF TERMS

REFUELING TRACKS

1. ARIP – Air Refueling Initial Point – A point located upstream from the ARCP at which the receiver aircraft initiates a rendezvous with the tanker. Descent to refueling altitude will be made between ARIP and ARCP.
2. ARCP – Air Refueling Control Point – The location where the tanker and receiver rendezvous is completed prior to refueling. Tankers orbit at this point.
3. NAVIGATION CHECKPOINTS – These are designated where required to provide a means for adequate navigation for refueling aircraft, and for departure from the track subsequent to refueling.
4. EXIT – The point at which the refueling track terminates.
5. COMMUNICATION/RENDEZVOUS PLAN –
 - a. Primary UHF
 - b. Backup UHF
 - c. APN 69/134/135 Setting
 - d. APX 78/Encode/Decode
 - e. TACAN Channels Receiver/Tanker
 - f. N/R = Not required.
6. REFUELING ALTITUDES – The block of airspace within which refueling operations may be conducted.
7. SCHEDULING UNIT – The military unit responsible for scheduling refueling operations. It provides daily schedules covering requested altitudes/flight levels and times of use for proposed operations to the assigned ARTCC.
8. ASSIGNED ARTCC – The FAA Air Traffic Control Center that controls the airspace within which the track is located.
9. SODAR – Simultaneous Opposite Direction Air Refueling.

REFUELING ANCHORS

1. ENTRY POINTS – These are designated points where tanker aircraft may enter the anchor area without the assistance of radar. When either FAA Center Radar or Ground TAC Radar is operative, a tanker may proceed to the Anchor Point without crossing an Entry Point.
2. ANCHOR POINT – The geographical point upon which the anchor pattern is oriented.
3. ANCHOR PATTERN – A left-hand race track pattern with legs separated by a minimum of 20 NM and a minimum leg length of 50 NM.
4. EXIT POINTS – These are designated points where tanker and receiver aircraft may depart the anchor area after refueling is completed.
5. MILITARY RADAR – The call sign and frequencies of the military unit responsible for radar control of refueling operations within the anchor area. These are normally an ADCF (Air Defense Control Facility) or CRC/CRP (Control and Reporting Center/Post).

ARTCC FREQUENCIES

The ARTCC frequencies to be used at the control and/or exit points are listed under the "Assigned ARTCC" column, e.g., ARCP 297.3 EXIT 295.4

NOTE: The location of the refueling airspace is depicted in graphic format following the Aerial Refueling Tracks/Anchors table. If there is no information for a particular field, it will be omitted.

MILITARY AERIAL REFUELING TRACKS

Military Aircraft conduct refueling operations in Alaska below 10,000' MSL in VFR conditions on the routes listed below. A notice to airmen (AIRAD) will be issued at least 24 hours prior to the use of these routes. Refueling operations will be conducted about twice a month on each route for a maximum period of three hours. Only one HC-130 tanker and two HH-60 helicopters will engage in refueling operations on any given route. Refueling aircraft may use Mode 3, Code 4000 for discrete IFF operations. HC-130 tanker will monitor 122.9 (Valley Traffic).

Routes - Name, Navaid, Radial, Distance

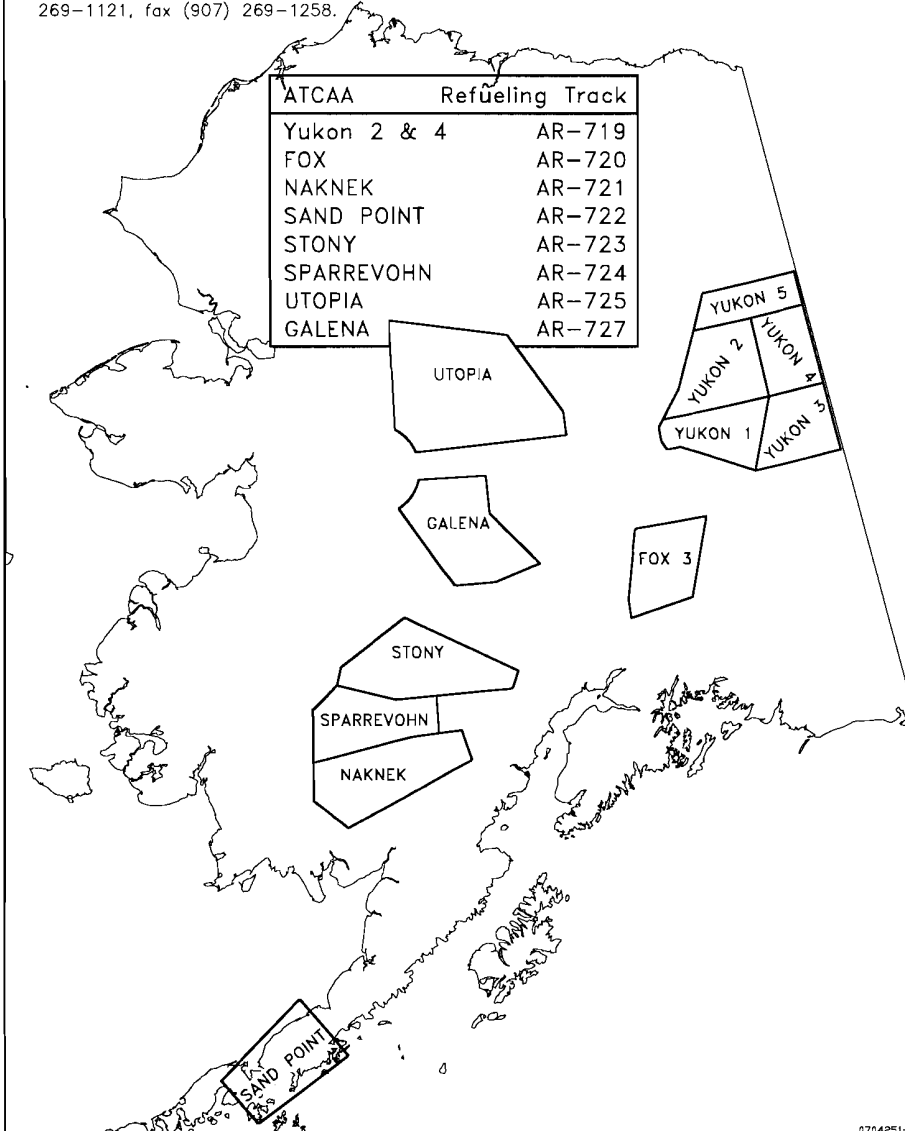

* Talkeetna One TKA 190/15-90	Galena One GAL 125/15-150	Kenai One ENA 200/50-100
Galena Two GAL 360/15-90	Nenana One ENN 200/15-90	King Salmon One AKN 180/15-90
King Salmon Two AKN 360/15-90	*Talkeetna One Route will be utilized on a regular weekly basis between 1000-1500 and 1800-2300 hours local time on Monday through Friday.	

MILITARY AERIAL REFUELING ARSPACE AIR TRAFFIC CONTROL ASSIGNED AIRSPACE (ATCAA)

Military Aircraft conduct refueling operations in Alaska in the airspaces shown below, normally between FL 240 and FL 290, on an IFR flight plan at assigned altitude(s). Refueling aircraft have right of way over other aircraft in accordance with FAR 91.113d(d). USN/USMC aircraft may operate green anticollision light(s) identifying aircraft involved in aerial refueling operations. When displayed, these lights will be used in conjunction with standard position lights. It is recommended pilots contact the nearest Flight Service Station for the latest information concerning Military Aerial Refueling Airspace (ATCAA) areas/Air Traffic Control Assigned Airspace (ATCAA) areas. Comments may be directed to FAA Military Operations Branch, AAL-530, 700 N. Boniface Pkwy., Anchorage, Alaska 99506-1697, (907) 269-1121, fax (907) 269-1258.

Alaskan Military Training Routes (IR & VR)

This graphic identifies IFR and VFR MTR ground tracks, and also includes Military Operations Areas & Restricted Areas. Operations on MTRs are conducted in accordance with instrument and visual flight rules, at speeds as high as 540Kts. Current information concerning the route use is available from the appropriate Flight Service Station within 100 miles of the route, by Anchorage Center, or the Special Use Airspace Information Service (see SUAIS page in this supplement for more information on interior routes near Eielson AFB). Most MTRs are charted on Enroute Low Altitude IFR charts and all are charted on Sectionals. Contact 11th Air Force Airspace Manager, at (907) 552-0999 for information regarding management or scheduling of Alaskan MTRs.

WEATHER/NOTAM PROCEDURES

Volcanic Eruptions in Alaska

Volcanic ash is a serious hazard to aviation in Alaska and throughout the North Pacific region. More than forty historically active volcanoes (those that have erupted or had significant unrest since the mid-1700s) are located along an arc from the Wrangell Mountains east of Anchorage to Kiska Island in the Western Aleutians. An average of 1–2 Alaskan volcanoes per year have explosive, ash-producing eruptions. In addition, ash from eruptions at 29 volcanoes on the Kamchatka Peninsula and 36 volcanoes in the Kurile Islands can also threaten air traffic over Alaska.

Notification of Volcanic Activity

As of April 1, 2007, the Alaska Volcano Observatory (AVO) continuously monitors earthquake activity at 30 volcanoes in Alaska (see graphic). Using these data, as well as information from satellites, ground observers, and pilot reports, AVO distributes announcements of volcanic eruptions and volcanic unrest via phone, fax, electronic mail, and the Internet directly to the FAA, the National Weather Service (NWS), the media, and the public.

The FAA disseminates volcanic information provided by AVO, NWS, and pilot reports. Air traffic controllers assist flight crews by alerting aircraft of the presence or possible presence of volcanic ash, and soliciting, relaying, and recording pilot reports of volcanic activity. With pilot concurrence, they may suggest headings or reroutes around known ash or possible ash cloud areas. When necessary, the FAA will issue Volcano Advisory NOTAMs as well as Temporary Flight Restrictions (TFRs).

The NWS provides the Alaskan aviation community with forecasts and warnings for volcanic ash in the atmosphere. They provide satellite imagery interpretations of ash plume boundaries, cloud top measurements, and movement forecasts. They also provide summaries of pilot reports containing volcanic ash information. The Alaska Aviation Weather Unit (AAWU) is the Volcanic Ash Advisory Center (VAAC) for the Alaska FIR. They issue Volcanic Ash Advisory Statements (VAAS) and SIGMETs depending on the severity of the volcanic hazard. The Center Weather Service Unit (CWSU) at Anchorage ARTCC issues Center Weather Advisories (CWAs) and volcanic Meteorological Impact Statements (MIS) which contain information about eruptions and location of volcanic ash. The National Oceanic and Atmospheric Administration (NOAA) releases forecasts of potential ash cloud movement in graphical format to domestic and international airlines as well as other government and commercial users.

The Aviation Color Code

AVO uses a color-code system to summarize a volcano's status and hazard to aviation. A similar system is used for volcanoes in Kamchatka.

AVIATION COLOR CODE (updated October 2006)

Color	Description
GREEN	Volcano is in typical background, noneruptive state <i>Or, after a change from a higher level,</i> Volcanic activity has ceased and volcano has returned to noneruptive background state.
YELLOW	Volcano is exhibiting signs of elevated unrest above known background level <i>Or, after a change from a higher level,</i> Volcanic activity has decreased significantly but continues to be closely monitored for possible renewed increase.
ORANGE	Volcano is exhibiting heightened or escalating unrest with increased potential of eruption, timeframe uncertain <i>Or,</i> Eruption is underway with no or minor volcanic-ash emissions.
RED	Eruption is imminent with significant emission of volcanic ash into the atmosphere likely <i>Or,</i> Eruption is underway or suspected with significant emission of volcanic ash into the atmosphere.

Pilot Reports of Volcanic Activity

Pilot reports of volcanic activity are of great assistance in detecting unrest at unmonitored volcanoes, accurately describing remote eruptions, and evaluating hazards to aviation. Flight crews are to report all volcanic activity immediately to ATC following procedures contained in the Aeronautical Information Manual (AIM). If possible, use the Volcanic Activity Reporting Form (VAR) depicted in Appendix 2 of the AIM and reproduced here following the map.

448 PROCEDURES

I. TELEPHONE WEATHER/NOTAM BRIEFING PROCEDURE

- A. Pilots clearing from a military location where military service is not locally available may obtain weather information by AUTOVON from the **nearest** facility listed below.
- B. Pilots clearing from a non-military location may obtain military weather information by long distance telephone, government collect, to the **nearest** facility listed below. Use the area code, telephone exchange, and base extension numbers listed. ANG and AFRES pilots departing their home station will obtain weather support as outlined in letter of agreement between their unit and the supporting AWS unit, as provided for by AF POLICY DIRECTIVE (AFPD) 15-1.
- C. When talking to a military forecaster, give him the following information:
 1. Name of person calling.
 2. Aircraft identification and type of aircraft.
 3. Departure point, destination, and alternate.
 4. VFR or IFR, proposed altitude.
 5. ETD, ETE, ETE to alternate.
 6. Route.
 7. Enroute stops if applicable (given in order with ETA's).
- D. NOTAM information may be obtained from operations personnel at the same number.

II. WEATHER NOTAM ABBREVIATIONS

BERM - Snowbanks/s containing earth/gravel

DRFT - Snowbank/s caused by wind action

FRZN - Frozen

FRZN SLR - frozen slush on runway/s

IN - Inch/s

IR - ice on runway/s

LSR - loose snow on runway/s

OBSC - Obscured (partially obscured nor reported)

OVR - Over

PLW - Plow/ed

PSR - Packed snow on runway/s

PTCHY - Patchy (airport management judgement decision)

RUF - Rough

SIR - Packed or compacted snow and ice on runway/s

SLR - Slush on runway/s

SNBNK - Snowbank/s caused by plowing (window/s)

SND - Sand/ed

SNW - Snow

THN - Thin

WSR - Wet snow on runway/s

WTR - Water on runway/s

NOTE: Measurement. The depth is always expressed in terms of thin (less than ¼ inch), ¼ inch, ½ inch, and 1 inch. When 1 inch is reached, additional reports should be in multiples of 1 inch and the use of fractions discontinued. If a variable amount is reported, such as 3 to 5 inches, show the greater depth. When a snow depth of 35 inches is reached, additional reports should be in multiples of feet only. If a report is halfway between two reportable values, round off to the next higher reportable value.

III. MILITARY WEATHER BRIEFING FACILITY LISTING

LOCATION	DSN	AREA CODE	COMMERCIAL NUMBER
Alaskan Wx OPS Cntr	317-552-2719/5199	907	552-2719/5199
Eielson AFB, Alaska	317-377-3140	907	337-3140
Elmendorf AFB, Alaska	317-552-4903/4397	907	552-4903/4397
McChord AFB, WA	976-6765	206	984-1910
Whidbey Island NAS, WA	820-2677/2676	206	257-2677/2676

IV. DND A/G WEATHER BROADCAST SERVICE

BROADCAST STATION	CW CALL SIGNS	EMISSION	TIME	AVIATION WEATHER REPORTS FOR:	CHART NO.
Edmonton	VXA	15035 kHz	(1200-2300Z)	VR — Vancouver QQ — Comox	H-1, L-1 H-1, L-1

V. PMSV PROCEDURES

Military pilots will make maximum use of "Pilot to Metro Service" (PMSV) when requesting or reporting enroute weather. The appropriate FAA facility will be notified before changing to PMSV and again upon returning to their facility. The radio call for PMSV is METRO, i.e. "Elmendorf METRO this is AF 12345." Call-up on VHF frequencies will be requested through "TOWER". When requesting terminal weather, advise forecaster/observer of your ETA. For overseas flights, use USAF Global Command Control System Stations whenever possible.

PILOT TO METRO SERVICE

FACILITY	FREQ	REMARKS	CHART NO.
Alaska WX OPS Center (Elmendorf AFB), Alaska	344.6		H-1, L-3
Eielson AFB, Alaska	344.6		H-1, L-4
Elmendorf AFB, Alaska	344.6		H-1, L-3
McChord AFB, WA	342.5		H-1
Whidbey Island NAS, WA	344.6		H-1, L-1

VI. CAUTIONARY ITEMS

Items which are not considered of sufficient importance to preclude safe termination/departure of flight, but require a cautionary warning to the pilot will be issued through the local air traffic control facility.

NOTE: Enroute and alternate meteorological watch is the pilot's responsibility. Weather forecasts may be updated through military PMSV or latest weather reports obtained from FAA FSS. Local terminal (destination) meteorological watch is a joint responsibility of the pilot and destination operations. AWS forecasters provide meteorological advice to local operations officers who are responsible for notifying landing pilots of adverse weather conditions.

VII. PILOT WEATHER REPORTS (PIREPS) FORMAT

- A. Pilots are urged to cooperate and volunteer reports of cloud tops, upper cloud layers, thunderstorms, ice, turbulence, strong winds, and other significant flight condition information. The PIREP should be transmitted to METRO, if possible, or to the ground control facility with which communication is established, i.e., FSS, ARTCC, ACC, etc. To further insure PIREP dissemination, Army pilots are encouraged to utilize and submit AE Form 1450 to destination weather facility.
- B. The following procedures are applicable when making in-flight weather reports:
 1. PILOT REPORTS WILL BE MADE UNDER THE FOLLOWING CONDITIONS:
 - a. In-flight, when requested.
 - b. When unusual and unforecast weather conditions are encountered.
 - c. When weather conditions on an IFR approach differ from the latest observation.
 - d. When a missed approach is executed due to weather.
 - e. When a wind shear is encountered on departure or arrival.
 2. PIREP FORMAT
 - a. Locations of phenomena (station identifier, radial/DME and route segment)
 - b. Time (UTC)
 - c. Altitude (MSL)
 - d. Type Aircraft
 - e. Skycover (bases, tops, and amount)
 - f. Air Temperature
 - g. Wind
 - h. Turbulence (see tables below)
 - i. Icing (see tables below)
 - j. Remarks
 3. TURBULENCE REPORTING TABLES — REPORT THE TURBULENCE INTENSITY AND FREQUENCY.

a. INTENSITY	AIRCRAFT REACTION	REACTION INSIDE AIRCRAFT
LIGHT	<p>LIGHT TURBULENCE: Turbulence that momentarily causes slight, erratic changes in altitude and/or attitude.</p> <p>LIGHT CHOP: Turbulence that causes slight, rapid and somewhat rhythmic bumpiness without appreciable changes in altitude or attitude.</p>	Occupants may feel a slight strain against seat belts or shoulder straps. Unsecured objects may be displaced slightly. Food service may be conducted and little or no difficulty is encountered in walking.
MODERATE	<p>MODERATE TURBULENCE: Turbulence that causes changes in altitude and/or attitude, but with the aircraft remaining in positive control at all times. It usually causes variations in indicated airspeed.</p> <p>MODERATE CHOP: Turbulence that causes rapid bumps or jolts without appreciable changes in aircraft altitude or attitude.</p>	Occupants feel definite strains against seat belts or shoulder straps. Unsecured objects are dislodged. Food service and walking are difficult.

SEVERE	SEVERE TURBULENCE: Turbulence that causes large, abrupt changes in altitude and/or attitude. It usually causes large variations in indicated airspeed. Aircraft may be momentarily out of control.	Occupants are forced violently against seat belts or shoulder straps. Unsecured objects are tossed about. Food service and walking are impossible.
EXTREME	EXTREME TURBULENCE: Turbulence in which the aircraft is violently tossed about and is practically impossible to control. It may cause structural damage.	
b. FREQUENCY	DEFINITION	
1. Occasional	Less than $\frac{1}{2}$ of the time.	
2. Intermittent	Occurring $\frac{1}{2}$ to $\frac{2}{3}$ of the time.	
3. Continuous	Occurring more than $\frac{2}{3}$ of the time.	

Clear Air Turbulence: (CAT): High level turbulence (normally above 15,000 feet MSL) not associated with cumulonimbus clouds should be reported as CAT, preceded by the appropriate intensity. The success of the CAT Forecast Program depends heavily on CAT PIREPS.

4. AIRFRAME ICING REPORTING TABLES —REPORT ICING INTENSITY AND TYPE.

a. INTENSITY	ICE ACCUMULATION
TRACE	Ice becomes perceptible. Rate of accumulation slightly greater than rate of sublimation. It is not hazardous even though de-icing/anti-icing equipment is not used, unless encountered for an extended period of time (over one hour).
LIGHT	The rate of accumulation may create a problem if flight is prolonged in this environment (over one hour). Occasional use of de-icing/anti-icing equipment removes/prevents accumulation. It does not present a problem if the de-icing/anti-icing equipment is used.
MODERATE	The rate of accumulation is such that even short encounters become potentially hazardous and use of de-icing/anti-icing equipment or diversion is necessary.
SEVERE	The rate of accumulation is such that de-icing/anti-icing equipment fails to reduce or control the hazard. Immediate diversion is necessary.
b. TYPE	DEFINITION
RIME ICE	Rough, milky, opaque ice formed by the instantaneous freezing of small super cooled water droplets.
CLEAR ICE	Glossy, clear or translucent ice formed by the relatively slow freezing of large super cooled water droplets.
MIXED ICING	A mixture of clear and rime ice.

SEVERE WEATHER AVOIDANCE

- Pilots should avoid flight in the vicinity of known or forecast severe weather such as thunderstorm activity, severe turbulence and hail.
- Forward reports to ATC of any severe weather encountered giving nature, locations, route, altitude and intensity. These in-flight reports to controllers giving specific information can be of considerable value. Review Federal Aviation Regulation 91.183 pertaining to pilot reports.
- To avoid a severe weather situation along the route, request such deviation from route/altitude as far in advance as possible.
- In accordance with current procedures, controllers will provide information concerning severe weather echoes observed on their radar when deemed advisable and will, upon pilot request, provide vectors for avoidance whenever circumstances will permit. However, it is emphasized that pilots should not completely rely on air traffic controllers to provide this service at all times, particularly in terminal areas or in holding patterns. Due to limitations of ATC radar equipment and its location relative to the weather observed, the controllers capability to provide the service may be reduced.

WIND SHEAR PIREPS

Because unexpected changes in wind speed and directions can be hazardous to aircraft operations at low altitudes on approach to and departing from airports, pilots are urged to volunteer reports to controllers of wind shear conditions they encounter. An advance warning of this information will assist other pilots in avoiding or coping with a wind shear on approach or departure.

When describing conditions, use of the terms "negative" or "positive" wind shear should be avoided. PIREPs of "negative wind shear on final," intended to describe loss of airspeed and lift, have been interpreted to mean that no wind shear was encountered. The recommended method for wind shear reporting is to state the loss/gain of airspeed and altitude/s at which it was encountered. Examples are: "Denver Tower, Cessna 1234 encountered wind shear, loss of 20 knots at 400 feet," ("Tulsa Tower, American 721 encountered wind shear on final, gained 25 knots between 600 and 400 feet followed by loss of 40 knots between 400 feet and surface." Pilots who are not able to report wind shear in these specific terms are encouraged to make reports in terms of the effect upon their aircraft. For example: "Miami Tower, Gulfstream 403 Charlie encountered an abrupt wind shear at 800 feet on final, max thrust required." Pilots using Inertia Navigation Systems should report the wind and altitude both above and below the shear layer.

INSTRUMENT DEPARTURES AT CIVIL AIRPORTS

1. STANDARD INSTRUMENT DEPARTURES (SIDs)

(Military Pilots Consult Appropriate Regulations)

- A Standard Instrument Departure (SID) is an air traffic control coded departure routing which has been established at certain airports to simplify clearance delivery procedures.
- Pilots of aircraft operating under Instrument Flight Rules (IFR) at airports for which SIDs have been published may be issued clearances whenever ATC determines it is appropriate.
- SIDs are published by the U.S. Government.
- Pilots of IFR aircraft who do not wish to use a SID may so indicate by inclusion of "NO SID" in the remarks section of their filed flight plan or by advising ATC "NO SIDs" at the time IFR departure clearance is requested.
- Pilots of IFR civil non-air carrier aircraft who will accept a SID may so indicate by inclusion of the acronym 'SID' as the first routing item in their filed flight plan or by advising ATC 'HAVE SIDS' at the time IFR departure clearance is requested.

2. OBSTRUCTION CLEARANCE DURING DEPARTURE

- IFR departure procedures have been established to assist the pilots conducting IFR flight in avoiding obstructions during climbout to minimum enroute altitude. These procedures are established only at locations where instrument approach procedures are published and when required due to obstructions.
- These procedures may be a weather ceiling and visibility requirement due to obstructions close in to the airport, or detailed flight maneuvers particularly at locations in mountainous terrain. In many cases obstruction avoidance procedures are incorporated into established SIDs and the SID is referenced as the obstruction avoidance procedure. In this case when a pilot desires to utilize the SID, it should be filed in the flight plan as the first item of the requested routing.
- U.S. Government Instrument Approach Procedures are being converted to a new chart format (see Advisory Circular 90-1A). Instrument approach charts in the old format have takeoff minimums and departure procedures published on the chart. Procedures published under the revised format do not contain this information. Takeoff minimums are standard (see FAR 91.175 (f and g) unless the symbol  is shown under the minimums box indicating that the separate listing should be consulted. The symbol  is also used when an IFR departure procedure has been established. This listing is provided for each area instrument approach procedure book. (Below is an example of this listing.)

INSTRUMENT APPROACH PROCEDURES (CHARTS)

IFR TAKE-OFF MINIMUMS AND DEPARTURE PROCEDURES

Civil Airports and Selected Military Airports

CIVIL USERS: FAR 91 prescribes take-off rules and establishes take-off minimums as follows:

- (1) Aircraft having two engines or less — one statute mile. (2) Aircraft having more than two engines — one-half statute mile.

MILITARY USERS: Special IFR departure procedures, not published as Standard Instrument Departure (SIDs), and civil take-off minima are included below and are established to assist pilots in obstruction avoidance. Refer to appropriate service directives for take-off minimums.

Airports with IFR take-off minimums other than standard are listed below. Departure procedures and/or ceiling visibility minimums are established to assist pilots conducting IFR flight in avoiding obstructions during climb to the minimum enroute altitude. Take-off minimums and departures apply to all runways unless otherwise specified. Altitudes, unless otherwise indicated, are minimum altitudes in feet MSL.

NAME	TAKE-OFF MINIMUMS
------	-------------------

BIG LAKE, AK	Rwy 6, 24, 200-1
--------------------	------------------

FAIRBANKS INTL, AK

IFR DEPARTURE PROCEDURE: W and N bound (190° CW 020°), Rwy 1L/R turn right, climb on 020° to 2000, Rwy 19L/R climb runway heading to 2000, thence climb via assigned route.

452 PROCEDURES

d. Each pilot, prior to departing an airport on an IFR flight should consider the type of terrain and other obstructions on or in the vicinity of the departure airport and take the following action.

(1) Determine whether a departure procedure and/or Standard Instrument Departure (SID) is available for obstruction avoidance.

(2) Determine if obstruction avoidance can be maintained visually or that the departure procedure should be followed.

(3) At airports where instrument approach procedures have not been published, hence no published departure, procedure determine what action will be necessary and take such action that will assure a safe departure.

PILOT PROCEDURES WITH ARTC CENTERS.

I. RADAR ENVIRONMENT

- a. Discontinue position reports when advised that your aircraft is in radar contact. Subsequent to being advised that the controller has established radar contact this fact will not be repeated to the pilot when he is handed off to another controller. Resume normal position reporting when ATC advises radar contact lost or radar service terminated.
- b. When a radio frequency change is made use the following:
 - a. Anchorage Center (this is) Air Force 12345 at 17,000, over or
 - Anchorage Center (this is) Air Force 12345 at 17,000 descending to 10,000, over.

II. NON-RADAR ENVIRONMENT

A. Normal position reporting procedure, unless advised otherwise by Center.

B. INITIAL CONTACT PROCEDURES IN NON-RADAR ENVIRONMENT

1. When contact is to be followed by a position report, tell the controller your position, e.g.:
 - a. Anchorage Center (this is) Air Force 12345, Big Lake, over.
2. When contact is to be made at a specific time or place and no position report is required, give estimate of next reporting point and altitude/flight level and the altitude/flight level to which you are descending or climbing, Examples:
 - a. Anchorage Center (this is) Navy 54321, estimating Kenai four two, at FL 270.
 - b. Anchorage (this is) Navy 54321, estimating Kenai four two, at nine thousand descending to five thousand.
3. A pilot unable to contact a facility on the frequency specified is responsible for initiating contact on another appropriate frequency or through the nearest FSS.

NOTE: ICAO procedures require the decimal point to be spoken as "decimal" and FAA-ATC will honor such usage by military aircraft.

NOTE: Words (this is) may be omitted if no confusion or misinterpretation will result.

AIR ROUTE TRAFFIC CONTROL CENTER (ARTCC) COMMUNICATIONS

1. NORMAL — Communications between ARTCC controllers and pilots of IFR aircraft will be conducted via direct controller-to-pilot communications channels using the appropriate ARTC SECTOR discrete frequency. Pilots will be advised of the frequency to be used and when a frequency change is required. Communications between ARTCC controllers and pilots of IFR aircraft that do not have in-flight tuning capability will be conducted by relay through the FSS.
2. EMERGENCY FREQUENCIES — Direct controller-to-pilot communications capability 121.5/243.0 MHz is limited to the area (dependent upon the location/altitude of the aircraft) within the vicinity of the ARTC Center since these frequencies are installed for center use at the local ARTC Center transmitting/receiving site only.
3. ADDITIONAL REPORTS

a. The following reports should be made to ATC or FSS facilities without a specific ATC request:

(1) At all times:

- (a) When vacating any previously assigned altitude or flight level for a newly assigned altitude or flight level.
- (b) When an altitude change will be made if operating on a clearance specifying VFR ON TOP.
- (c) When **unable** to climb/descend at a rate of at least 500 feet per minute.
- (d) When approach has been missed. (Request clearance for specific action; i.e., to alternative airport, another approach, etc.)
- (e) Change in the average true airspeed (at cruising altitude) when it varies by 5 percent or 10 knots (whichever is greater) from that filed in the flight plan.
- (f) The time and altitude or flight level upon reaching a holding fix or point to which cleared.
- (g) When leaving any assigned holding fix or point.

NOTE.—The reports in subparagraphs (f) and (g) may be omitted by pilots of aircraft involved in instrument training at military terminal area facilities when radar service is being provided.

- (h) Any loss, in controlled airspace, of VOR, TACAN, ADF, low frequency navigation receiver capability, complete or partial loss of ILS receiver capability or impairment of air/ground communications capability.
- (i) Any information relating to the safety of flight.

(2) When not in radar contact:

- (a) When leaving final approach fix inbound on final approach (non precision approach) or when leaving the outer marker or fix used in lieu of the outer marker inbound on final approach (precision approach).
- (b) A corrected estimate at anytime it becomes apparent that an estimate as previously submitted is in error in excess of 3 minutes.

b. Pilots encountering weather conditions which have not been forecast, or hazardous conditions which have been forecast, are expected to forward a report of such weather to ATC. (See PARA—520 - PILOT WEATHER REPORTS (PIREPs) and FAR—91.183(b) and (c).)

CIRVIS REPORTS

1. CIRVIS (pronounced **SUR VEES**) reports are reports of information of vital importance to the security of the United States and Canada and their forces, which in opinion of the observer, require very urgent defensive and/or investigative action by the U.S. and/or Canadian Armed Forces.
2. CIRVIS reports should be transmitted in plain language, as soon as possible, to any available U.S. or Canadian military or civil air/ground communications facility. Reporting procedures will be similar to those used when transmitting position reports except the call will be preceded by the word CIRVIS spoken three times to clear the frequency(ies) over all other communications, except DISTRESS and URGENCY. If this fails to clear the frequency(ies), the International Urgency Signal "XXX" transmitted three time or "PAN" spoken three time will be employed.
3. Additional CIRVIS reports should be made if more information on the sighting becomes available. These should contain a reference to the original report.
4. A CANCELLATION report should be made in the event a previously reported sighting is positively identified as friendly or that it has been erroneously reported.
5. REPORT IMMEDIATELY BY RADIO:
 - a. Hostile or unidentified single aircraft or formations of aircraft which appear to be directed against the United States, Canada or their forces.
 - b. Missiles.
 - c. Unidentified flying objects.
 - d. Hostile or unidentified group(s) of military surface vessels.
 - e. Hostile or unidentified submarines.
 - f. Individual surface vessels, submarines, or aircraft of unconventional design, or engaged in suspicious activity or observed in an unusual location or on a course which may be interpreted as constituting a threat to the United States, Canada, or their forces.
 - g. Any unexplained or unusual activity which may indicate a possible attack against or through the United States or Canada, including the presence of any unidentified or suspicious ground parties in the Polar region or other remote or sparsely populated areas.
6. UPON LANDING:
 - a. Reports which for any reason could not be transmitted while airborne.
 - b. Unlisted airfields, facilities, weather stations or air navigation aids.
 - c. Post landing reports (to include as many photographs as are obtained).
7. DO NOT REPORT craft or aircraft in normal passage or known U.S. or Canadian military or government vessels (including submarines) and aircraft.

MEACONING —INTRUSION —JAMMING AND INTERFERENCE (MIJI) PROCEDURES

1. Each operator of electromagnetic equipment is responsible for reporting MIJI incidents.
The following perishable information should be recorded at the time of the incident:
 - a. True course, ground speed and altitude (MSL).
 - b. Weather conditions.
 - c. Date/Time (Z)/Coordinates MIJI began.
 - d. Date/Time (Z)/Coordinates MIJI most effective.
 - e. Date/Time (Z)/Coordinates MIJI ended.
 - f. Bearing(s) to MIJI source with corresponding times (Z) and victim coordinates.
 - g. Frequency(ies) affected.
 - h. Call signs/audio characteristics/scope presentations, etc noted.
2. MIJI reports may be transmitted in flight if a secure communications mode is available; otherwise, report should be delayed until it can be transmitted via secure means. Refer to "FLIP" General Planning (GP) Chapter (2) and (5) for additional information.

TRAFFIC ADVISORIES AT NON-TOWER AIRPORTS

The current frequency for obtaining traffic advisory information at non-tower airports in Alaska is listed as the Common Traffic Advisory Frequency (CTAF) under the name of each airport in the Airport/Facility Directory section of the Alaska Supplement. Procedures for obtaining traffic information on the CTAF are as follows:

1. AIRPORT ADVISORY SERVICE AIRPORTS.

Flight Service Stations located at airports where there are no control towers in operation provide advisory information to arriving and departing aircraft on the CTAF. Traffic control is not provided. Airport advisories provide: wind direction (magnetic) and velocity, favored or designated runway, altimeter setting, known traffic (CAUTION: all aircraft in the airport vicinity may not be communicating with the FSS), notices to airmen, airport taxi routes, airport traffic patterns, and instrument approach procedures. Pilots using other than the favored or designated runways should advise the FSS immediately.

DEPARTING: When ready to taxi, the pilot should notify the station of the aircraft identification and type, location, type of flight planned (VFR or IFR), and destination. Report departure time as soon as practicable.

ARRIVING: When operating VFR, the pilot should transmit position and altitude information to the FSS when 15 miles from the airport. When operating IFR, provide this information when the controller advises. "Contact (location name) radio on (frequency)". Notify the FSS when leaving the runway.

454 PROCEDURES

2. NON-FSS AIRPORTS WHERE THE UNICOM OPERATOR OR MILITARY UNIT PROVIDES ADVISORY INFORMATION ON THE CTAF FREQUENCY.

DEPARTING: Monitor the CTAF as appropriate while taxiing and report on the CTAF before taking the runway for takeoff. The UNICOM/MILITARY operator normally provides runway, wind and at his discretion, traffic information.

ARRIVING: Call for runway in use, on the appropriate CTAF, when approximately 10 miles from the airport. If IFR, change to the CTAF when the controller advises "change to advisory frequency approved". Listen for other aircraft on the frequency. When entering downwind and final, inform the UNICOM/MILITARY operator of your position, altitude and intentions.

3. BLIND BROADCASTS OF POSITION OR INTENTIONS.

If there is no operating tower, operating FSS, or UNICOM/MILITARY, or when unable to communicate with an FSS on the CTAF or UNICOM/MILITARY operator: a. Blind-broadcast your intentions and position using the appropriate CTAF within 10 miles of the airport. b. Listen for other aircraft who may be broadcasting in the blind. (CAUTION: all aircraft may not be complying with the recommended blind-broadcast procedures).

a. Recommended Blind Broadcast Phraseologies—

(1) Inbound

Example:

STRAWN TRAFFIC, APACHE TWO TWO FIVE ZULU, ENTERING DOWNWIND FOR RUNWAY ONE SEVEN STRAWN.

(2) Outbound

Example:

STRAWN TRAFFIC, QUEENAIRE SEVEN ONE FIVE BRAVO DEPARTING RUNWAY TWO SIX STRAWN.

4. AERONAUTICAL ADVISORY STATIONS (UNICOM)

- a. UNICOM is a nongovernment air/ground radio communication facility which may provide airport advisory services at certain airports. Locations and frequencies of UNICOMs are shown on aeronautical charts and publications.
- b. On pilot request UNICOM stations located at no tower/no FSS airports may provide pilots with weather information, wind direction, the runway the wind favors, and other necessary information.
- c. In communicating with a UNICOM station the following practices will help reduce frequency congestion, facilitate a better understanding of pilot intentions and location in the traffic pattern and enhance safety of flight:
 - 1. Select the correct UNICOM frequency.
 - 2. Call for runway in use approximately 10 miles from the airport. Listen on the frequency prior to transmitting since you may be able to pick up the runway in use and eliminate the need to make a transmission.
 - 3. State the identification of the UNICOM station you are calling in each transmission.
 - 4. Make sure you receive a response from the station being called since many stations and aircraft at other airports transmit on the same UNICOM frequency.
 - 5. Speak slowly and distinctly.
 - 6. To the extent practicable, confine your conversation to operational matters.
 - 7. UNICOM frequencies assigned to uncontrolled airports should not be used for air-to-air communications.

d. Recommended UNICOM Phraseologies:

(1) Inbound

Example:

FREDERICK UNICOM CESSNA 123 REQUEST AIRPORT ADVISORY.

FREDERICK UNICOM CESSNA 123 ENTERING DOWNWIND/FINAL FOR RUNWAY ONE NINE.

(2) Outbound

Example:

FREDERICK UNICOM CESSNA 123 DEPARTING RUNWAY ONE NINE.

PILOT VIP NOTIFICATION PROCEDURES (USAF AND NAVY INSTALLATIONS ONLY)

It is the responsibility of each Aircraft Commander transporting VIPs to insure that flight plans reflect high rank on board and follow up reporting is made approximately 15 min to 30 min prior to arrival at destination base. Follow up action is essential to preclude any embarrassment to the VIP, the Station Commander or the Aircraft Commander himself. When available Pilot to Dispatcher or Command Post radios should be used.

AUTOMATIC TERMINAL INFORMATION SERVICE (ATIS)

ATIS frequencies are incorporated on individual FLIP Terminal Instrument Approach Procedures, Enroute Charts and airport listings in the Enroute Supplement. Where this service is available, listing will be found on the WEATHER DATA SOURCES line, e.g., (ATIS 108.5). Pilots will be expected to listen to ATIS broadcasts where in operation to obtain essential, but routine, terminal information. The following procedures apply:

A. ATIS broadcasts are recorded and the pilot should notify controllers that he has received the broadcast by repeating the alphabetical code word appended to the broadcast. Example: "INFORMATION ECHO RECEIVED".

B. When the pilot acknowledges that he has received the ATIS broadcast, controllers may omit those items contained on the broadcast if they are current. Rapidly changing conditions will be issued by Air Traffic Control and the ATIS will contain words as follows:

"LATEST CEILING/VISIBILITY/ALTIMETER/WIND/(OTHER CONDITIONS)
WILL BE ISSUED BY APPROACH CONTROL/TOWER."

C. The absence of a sky condition and/or visibility on ATIS indicates a ceiling of 5000 feet or above and visibility of 5 miles or more. A remark may be made on the broadcast, "The weather is better than 5000 and 5," or the existing weather may be broadcast.

D. Controllers will automatically issue pertinent information to pilots who do not acknowledge receipt of the ATIS broadcast or who acknowledge receipt of a broadcast which is not current.

ALTIMETER SETTINGS

1. The cruising altitude or flight level of aircraft shall be maintained by reference to an altimeter which shall be set:
 - a. **Below 18,000' MSL** — to the current reported altimeter setting along the route of flight or, in the case of an aircraft having no radio, to the altimeter setting of the airport of departure.
 - b. **At or above 18,000' MSL (FL 180)** — 29.92 Hg (standard setting).
- VFR pilots will add an adjustment factor to their Flight Level*, as a safety measure for terrain clearance, when lower altimeter settings are reported:

ALTIMETER SETTING (Current Reported)	LOWEST USABLE FLIGHT LEVEL	ADJUSTMENT FACTOR
29.92 or higher	180	None
29.91 to 29.42	185	500 feet
29.41 to 28.92	190	1000 feet
28.91 to 28.42	195	1500 feet
28.41 to 27.92	200	2000 feet
27.91 to 27.42	205	2500 feet
27.41 to 26.92	210	3000 feet

EXAMPLE: Altimeter setting 29.41, change must be made no lower than FL 190.

- c. **Climbing** — Change to 29.92 Hg upon reaching 18,000' MSL.
- d. **Descending** — Changes to local altimeter setting prior to reaching lowest usable flight level and in all cases, prior to reaching FL 180.

2. The above procedures are effective within the Alaska Airspace and are to be applied for Air Traffic Control purposes within the following navigable airspace:

- a. Within 100 NM either side of a line extending from Eareckson AFS through Adak Naval Station Airport, Nikolski Airport, and Cold Bay Airport to a point at 56°20'N, 160°00'W, including that area to the south of Cold Bay bounded by a line beginning at 53°30' N, 160°00'W to 54°00'N, 164°00'W.
- b. Between the coastline of Alaska and the inshore boundaries of the respective oceanic flight information regions. All other over water fits will use the standard sea level pressure ONE (29.92" Hg) altimeter setting to within 100 NM of land fall.

Low temperature error: "Extreme low temperatures" will cause serious errors in indicated altitude. It is suggested that the next higher altitude than normal, appropriate to direction of flight, be requested on routes with minimum enroute altitudes greater than 5000'.

On a route 13,000' temperature — 40°F, aircraft may be 1500' lower than indicated altitude.

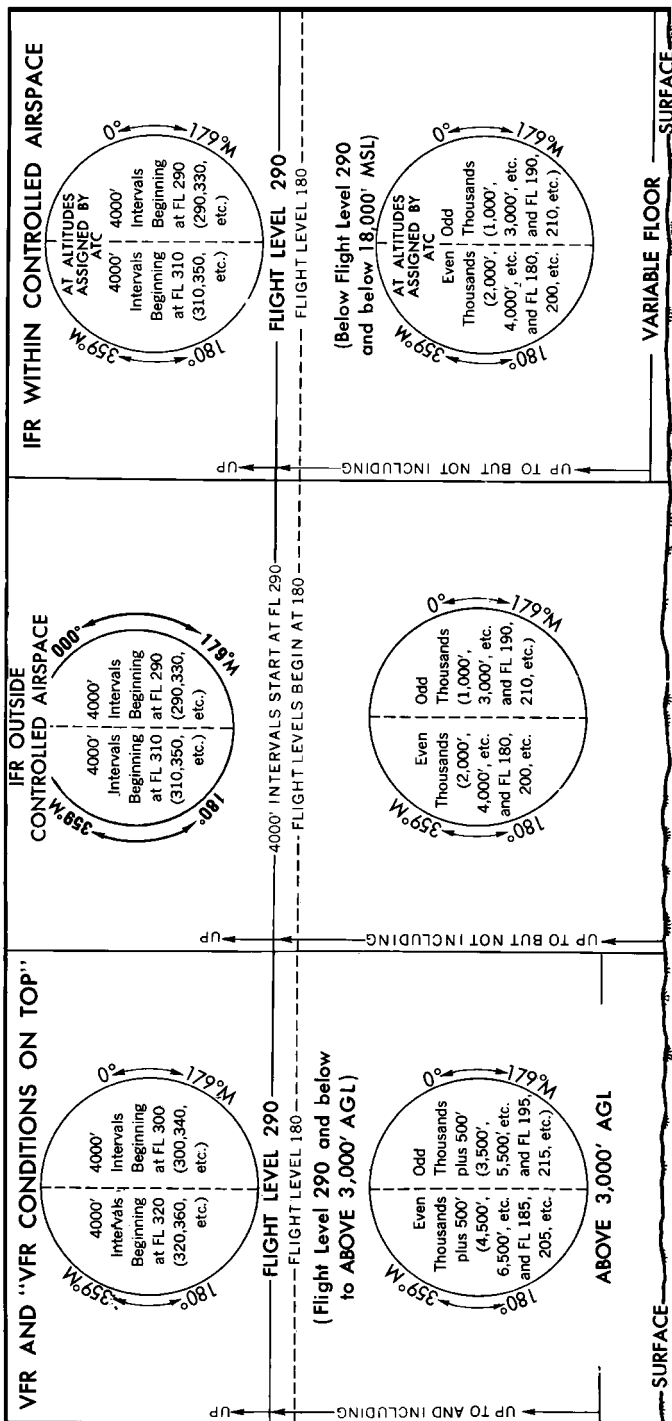

On a route 10,000' temperature — 30°F, aircraft may be 1000' lower than indicated altitude.

High Barometric Pressure—

- a. Cold, dry air masses may produce barometric pressures in excess of 31.00 inches of Mercury. Most altimeters do not have an accurate means of being adjusted for altimeter settings of these levels.
- b. The altimeter setting announced by air traffic controllers will be 31.00 inches of Mercury (Three One Zero Zero) when the barometric pressure equals or exceeds that value. Actual barometric pressure will be provided upon request.
- c. The altimeter error caused by the high pressure will be in the opposite direction to the error caused by the cold temperature.

*VFR hemispheric Cruising Altitude or Flight Level (See FAR 91.159).

CRUISING ALTITUDE DIAGRAMS

AIRPORT TRAFFIC CONTROL LIGHT SIGNALS

Aircraft without radio equipment should observe the tower for light signals. Acknowledge signals in the daytime by movement of ailerons or rudder on the ground and by rocking wings in the air. Acknowledge signals at night by flashing aircraft lights. Signals from an airport traffic control light gun have the following meanings:

Color and Type of Signal	On the Ground	In Flight
STEADY GREEN FLASHING GREEN	Clear for take-off Cleared to Taxi	Cleared to land. Return for landing (to be followed by steady green at proper time)
STEADY RED	Stop	Give way to other aircraft and continue circling
FLASHING RED	Taxi clear of landing area (runway) in use.	Airport unsafe—do not land
FLASHING WHITE	Return to starting point on airport	
ALTERNATING RED and GREEN	General Warning Signal — Exercise Extreme Caution	
RED PYROTECHNICAL LIGHT		Notwithstanding any previous instructions. Do not land for the time being.

USAF RADAR ASSISTANCE SERVICE

Radar Assistance Service is designed to assist aircraft in flight to avoid areas of potentially hazardous conditions such as weather, anti-aircraft artillery zones, restricted areas, warning areas, etc. This service does not provide for routine navigational assistance, the relay of normal position reports, or general air traffic information.

1. PROCEDURES.

a. A pilot will request Radar Assistance Service through use of the term "Radar Assistance" using the following radio frequencies:

Military Aircraft	— 364.2 126.2 (236.6 for Northern DEW stations).
Civil Aircraft	— 126.2 Northern DEW stations and Alaska ACW radar stations.

Example: "Radar Assistance" THIS IS (Identification, Position, Heading), IFR/VFR FLIGHT PLAN, OVER. Thereafter the pilot will use the call sign of the radar unit which responds.

b. Whenever airborne equipment permits, the pilot on an IFR flight plan will continue to guard the normal en route ATC frequency while in contact with the radar unit. When this is possible, it will not be necessary for the pilot to advise the ATC guard station that he is about to contact the radar unit for advisory service.

c. If it is necessary to leave the normal enroute ATC frequency in order to contact the radar unit, the pilot on an IFR flight plan will request permission (direct or via appropriate communications station) from the Air Route Traffic Control Center (ARTCC) to leave the ATC frequency.

d. The pilot should immediately return to the normal enroute frequency and report when:

- (1) The procedural word "Unable" (used by radar units when assistance service cannot be furnished for any reason) is received from the radar station. The receipt of this word will be final and no further explanation will be required.
- (2) Radio contact with the radar unit is lost.
- (3) Notified by the radar unit that radar contact has been lost.
- (4) The assistance service is completed.

e. Radar assistance information to a pilot is advisory only and does not relieve the pilot of his responsibility to see and avoid other aircraft. Radar detected traffic and weather advisories are provided only as an aid and no control or responsibility will be assumed by the USAF or its operating agents. Pilots are reminded that the surveillance radar utilized does not provide altitude information and may not display all aircraft.

SPECIAL VISUAL FLIGHT RULES

Federal Aviation Regulations impose restrictions and establish priorities with respect to the conduct of Special VFR operations. Basically, the new rules prohibit Fixed Wing Special VFR (FW/SVFR) operations in specified CLASS D/CLASS E airspace and the preamble establishes the policy that IFR Aircraft will be given priority over FW/SVFR aircraft in all other CLASS D/CLASS E airspace. Helicopter special VFR operations are not affected by these changes. FW/SVFR shall be applied as follows:

1. USAF: USAF fixed wing aircraft are not permitted to operate under special VFR conditions within CLASS D/CLASS E airspace.
2. U. S. NAVY, U. S. ARMY AND CIVIL: Where a person has received an appropriate ATC clearance, FAR Part 91.157 permits special VFR operations for fixed wing aircraft within CLASS D/CLASS E airspace with weather minima of 1 mile visibility and clear of clouds. However, special VFR operations for fixed wing aircraft are prohibited at Seattle, Wash. (Seattle-Tacoma Intl Airport) in accordance with FAR Part 91 Appendix D. Special VFR is authorized on PILOT REQUEST ONLY.

VFR ADVISORY INFORMATION

VFR advisory information is provided by numerous radar and non-radar approach control facilities to those pilots intending to land at an airport served by an Approach Control tower. This information includes: wind, runway, traffic and NOTAM information.

Such information will be furnished upon initial contact with concerned approach control facility. The pilot will be requested to change to the tower frequency at a pre-determined time or point, to receive further landing information.

Where available, use of this procedure will not hinder the operation of VFR flights by requiring excessive spacing between aircraft or devious routing. Radio contact points will be based on time or distance rather than on landmarks.

1. **Radar Traffic Information Service** —When VFR advisory information is provided by approach control facilities, pilots are advised of information on any aircraft observed on the radar scope which, in the judgment of the controller, appears to constitute a potential conflict to the operation of their aircraft.

a. **Purpose of the Service** —RADAR TRAFFIC INFORMATION SERVICE IS NOT INTENDED TO RELIEVE THE PILOT OF HIS RESPONSIBILITY FOR CONTINUAL VIGILANCE TO SEE AND AVOID OTHER AIRCRAFT. IT IS PROVIDED TO AID HIM IN HIS VISUAL SURVEILLANCE BY CALLING TO HIS ATTENTION A SPECIFIC DIRECTION IN WHICH RADAR INDICATES POSSIBLE CONFLICTING TRAFFIC TO EXIST. PILOTS ARE REMINDED THAT THE SURVEILLANCE RADAR UTILIZED BY THE CONTROLLER DOES NOT PROVIDE ALTITUDE INFORMATION AND MAY NOT DISPLAY ALL AIRCRAFT.

b. **Provision of the Service** —The provision of this service is not mandatory. Many factors (such as limitations of the radar, volume of traffic, controller workload and communications frequency congestion) could prevent the controller from providing this service. The controller possesses complete discretion for determining whether he is able to provide or continue to provide this service in a specific case. His reason against providing or continuing to provide the service in a particular case is not subject to question nor need it be communicated to the pilot. In other words, the provision of this service is entirely dependent upon whether the controller believes he is in a position to provide it. Subject to the foregoing limitations:

(1) Traffic information is routinely provided to all aircraft operating on IFR flight plans except when the pilot advises he does not desire the service.

(2) Traffic information may be provided for flights not operating on IFR flight plans when requested by pilots of such flights. NOTE: Participation by VFR pilots in formal programs implemented at certain terminal locations (see Special Notices) constitutes pilot request. This also applies to participating pilots at those locations where arriving VFR flights are encouraged to make their first contact with the tower on the approach control frequency.

c. **Issuance of Traffic Information** —Traffic information will include the following concerning the "target" constituting traffic.

(1) Azimuth from the aircraft, in terms of the twelve hour clock;

(2) Distance from the aircraft in nautical miles; and

(3) Direction in which the "target" is proceeding.

(4) Relative movement.

Example: "Traffic 10 o'clock, 3 miles, Westbound/diverging."

The pilot may, upon receipt of traffic information, request a vector (heading) to avoid such traffic. The vector will be provided to the extent possible as determined by the controller.

AIR TRAFFIC CONTROL RADAR BEACON SYSTEM (ATCRBS)

1. GENERAL

a. Air Traffic Control Radar Beacon System (ATCRBS) is similar to and compatible with military coded radar beacon equipment. Civil Mode A is identical to military Mode 3.

b. Civil and military transponders should be adjusted to the "on" or normal operating position as late as practicable prior to takeoff and to "off" or "standby" as soon as practicable after completing landing roll unless the change to "standby" has been accomplished previously at the request of ATC. IN ALL CASES, WHETHER VFR OR IFR, THE TRANSPONDER SHOULD BE OPERATING WHILE AIRBORNE UNLESS OTHERWISE REQUESTED BY ATC.

c. If entering a U.S. domestic control area from outside the U.S., the pilot should advise on first radio contact with a U.S. radar air traffic control facility that such equipment is available by adding "transponder" to the aircraft identification.

d. It should be noted by all users of the ATC Transponders that the coverage they can expect is limited to "line of sight." Low altitude or aircraft antenna shielding by the aircraft itself may result in reduced range. Range can be improved by climbing to a higher altitude. It may be possible to minimize antenna shielding by locating the antenna where dead spots are only noticed during abnormal flight altitudes.

e. For ATC to utilize one or a combination of the 4096 discrete codes FOUR DIGIT CODE DESIGNATION will be used. e.g., code 2100 will be expressed as TWO ONE ZERO ZERO.

f. Pilots should be particularly sure to abide by the provisions of subparagraph b above. Additionally, due to the operational characteristics of the rapidly expanding automated air traffic control system. THE LAST TWO DIGITS OF THE SELECTED TRANSPONDER CODE SHOULD ALWAYS READ '00' UNLESS SPECIFICALLY REQUESTED BY ATC TO BE OTHERWISE.

g. Some transponders are equipped with a Mode C automatic altitude reporting capability. This system converts aircraft altitude in 100 foot increments, to coded digital information which is transmitted together with MODE C framing pulses to the interrogating radar facility. The manner in which transponder panels are designed differs, therefore, a pilot should be thoroughly familiar with the operation of his transponder so that ATC may realize its full capabilities.

h. Adjust transponder to reply on the Mode A/3 code specified by ATC and, if equipped, to reply on Mode C with altitude reporting capability activated unless deactivation is directed by ATC or unless the installed aircraft equipment has not been tested and calibrated as required by FAR 91.217. If deactivation is required by ATC, turn off the altitude reporting feature of your transponder. An instruction by ATC to "STOP ALTITUDE SQUAWK, ALTITUDE DIFFERS (number of feet) FEET," may be an indication that your transponder is transmitting incorrect altitude information or that you have an incorrect altimeter setting. While an incorrect altimeter setting has no effect on the Mode C altitude information transmitted by your transponder (transponders are preset at 29.92), it would cause you to fly at an actual altitude different from your assigned altitude. When a controller indicates that an altitude readout is invalid, the pilot should initiate a check to verify that the aircraft altimeter is set correctly.

i. Pilots of aircraft with operating Mode C altitude reporting transponders should report exact altitude/flight level to the nearest hundred foot increment when establishing initial contact with an air traffic control facility. Exact altitude/flight level reports on initial contact provide air traffic control with information that is required prior to using Mode C altitude information for separation purposes. This will significantly reduce altitude verification requests.

j. The transponder shall be operated only as specified by ATC. Activate the "IDENT" feature only upon request of the ATC controller.

k. Under no circumstances should a pilot of a civil aircraft operate the transponder on Code 0000. This code is reserved for military interceptor operations.

l. Military pilots operating VFR or IFR within restricted/warning areas should adjust their transponders to Code 4000 unless another code has been assigned by ATC.

m. When making routine code changes, pilots should avoid inadvertent selection of codes 7500, 7600 or 7700 thereby causing momentary false alarms at automated ground facilities. For example, when switching from code 2700 to code 7200, switch first to 2200 then 7200, NOT to 7700 and then 7200. This procedure applies to nondiscrete code 7500 and all discrete codes in the 7600 and 7700 series (i.e., 7600-7677, 7700-7777) which will trigger special indicators in automated facilities. Only nondiscrete code 7500 will be decoded as the hijack code. An aircraft's transponder code (when available) is utilized to enhance the tracking capabilities of the ATC facility, therefore, pilots should not turn the transponder to standby when making routine code changes.

n. New Transponder and Mode C requirements for aircraft flying above 12,500' and below 18,000' MSL went into effect July 1, 1975. Refer to FAR 91.215 for specific details concerning requirements, exceptions and ATC authorized deviations. In general, the FAR requires aircraft to be equipped with Mode A/3 (4096 codes) and Mode C altitude reporting capability when operating in controlled airspace of the 48 contiguous States and the District of Columbia above 12,500' MSL, excluding airspace at and below 2500' AGL. Pilots should insure that their aircraft transponder is operating on an appropriate or ATC assigned VFR/IFR code and Mode C when operating in such airspace. If in doubt about the operational status or either feature of your transponder while airborne, contact the nearest ATC facility of Flight Service Station and they will advise you what facility you should contact for determining the status of your equipment. Inflight requests for "immediate" deviation may be approved by controllers only when the flight will continue IFR or when weather conditions prevent VFR descent and continued VFR flight in airspace not affected by the FAR. All other requests for deviation should be made by contacting the nearest Flight Service/Air Traffic facility in person or by telephone. The nearest ARTC Center will normally be the controlling agency and is responsible for coordinating requests involving deviation in other ARTCC areas. (Note: CLASS A and CLASS B airspace deviation requests are handled as they have been in the past.

o. Pilots should be aware that proper application of these procedures will provide both VFR and IFR aircraft with a higher degree of safety in the environment where high-speed closure rates are possible. Transponders substantially increase the capability of radar to see an aircraft and the Mode C feature enables the controller to quickly determine where potential traffic conflicts may exist. Even VFR pilots who are not in contact with ATC will be afforded greater protection from IFR

460 PROCEDURES

aircraft and VFR aircraft which are receiving traffic advisories. Nevertheless, pilots should never relax their visual scanning vigilance for other aircraft.

2. INSTRUMENT FLIGHT RULES (IFR) FLIGHT PLAN

a. If the pilot cancels an IFR flight plan prior to reaching the terminal area of destination, the transponder should be adjusted according to the instructions below for VFR flight.

b. The transponder shall be operated only as specified by ATC. Activate the "IDENT" feature only upon request of the ATC controller.

3. VISUAL FLIGHT RULES (VFR)

a. Unless otherwise instructed by an Air Traffic Control Facility adjust Transponder to reply on Mode 3/A Code 1200 regardless of altitude.

b. Adjust transponder to reply on Mode C, with altitude reporting capability activated if the aircraft is so equipped, unless deactivation is directed by ATC or unless the installed equipment has not been tested and calibrated as required by FAR 91.217. If deactivation is required and your transponder is so designed, turn off the altitude reporting switch and continue to transmit MODE C framing pulses. If this capability does not exist, turn off MODE C.

4. SPECIAL MILITARY OPERATIONS

(1) NORAD interceptors operating under the AFIO and not under the control of ATC. Code 7777

(2) Aircraft operations which specify frequent or rapid changes in altitude/FL (flight test, olive branch, refueling, etc.) when assigned by ATC. Code 4000

(3) Mission requirements permitting, aircraft operating in restricted/warning areas unless a different code has been assigned by advance coordination or via direct communications with ATC. Code 4000

(4) MODE 3 — Code 4400, has been assigned for aircraft operating above FL600. This code will be preset on the ground and will not be changed in flight. However, the emergency code 7700 can be activated.

5. EMERGENCY OPERATION

a. When an emergency occurs, the pilot of an aircraft equipped with a coded radar beacon transponder, who desires to alert a ground radar facility to his emergency condition, and who cannot establish communications without delay with an air traffic control facility, may adjust the transponder to reply on Mode A/3, Code 7700.

b. Pilots should understand that they may not be within a radar coverage area and that, even if they are, certain radar facilities are not yet equipped to automatically recognize Code 7700 as an emergency signal. Therefore, they should establish radio communications with an air traffic control facility as soon as possible.

6. SPECIAL EMERGENCY

1. A special emergency is a condition of air piracy, or other hostile act by a person(s) aboard an aircraft, which threatens the safety of the aircraft or its passengers.

2. The pilot of an aircraft reporting a special emergency condition should:

a. If circumstances permit, apply distress or urgency radio-telephone procedures.

b. If circumstances do not permit the use of prescribed distress or urgency procedures, the message sent by the aircraft should:

(1) Be sent on the air-ground frequency in use at the time.

(2) Consist of as many as possible of the following elements spoken distinctly and in the following order:

(a) Name of the station addressed (time and circumstances permitting).

(b) The identification of the aircraft and present position.

(c) The nature of the special emergency condition and pilot intentions (circumstances permitting).

(d) If unable to provide (c) above, use code words and/or transponder setting for indicated meanings as follows:

Spoken Words

TRANSPONDER SEVEN FIVE ZERO ZERO

Meaning

Am being hijacked/forced to a new destination

Transponder Setting

Mode 3/A, Code 7500.

3. Code 7500 will never be assigned by air traffic control without prior notification from the pilot that his aircraft is being subjected to unlawful interference. The pilot should refuse the assignment of code 7500 in any other situation and inform the controller accordingly. Code 7500 will trigger the special emergency indicator in all radar ATC facilities.

4. Air traffic controllers will acknowledge and confirm receipt of transponder code 7500 by asking the pilot to verify it. If the aircraft is not being subjected to unlawful interference, the pilot should respond to the query by broadcasting in the clear that he is not being subjected to unlawful interference. Upon receipt of this information, the controller will request the pilot to verify the code selection depicted in the code selector windows in the transponder control panel and change the code to the appropriate setting. If the pilot replies in the affirmative or does not reply the controller will not ask further questions but will flight follow, respond to pilot requests and notify appropriate authorities.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

HIJACK PROCEDURES— RECOMMENDED PROCEDURES FOR U.S. PASSENGER AIRCRAFT HIJACKED TO THE COMMONWEALTH OF INDEPENDENT STATES, PEOPLE'S REPUBLIC OF CHINA, AND NORTH KOREA.—If it is possible to do so without jeopardizing the safety of the flight, the pilot of a hijacked U.S. passenger aircraft after departing from the cleared routing over which the aircraft was operating will attempt to do one or more of the following things insofar as circumstances may permit: (A) maintain a true airspeed of no more than 400 knots, and preferably an altitude of between 10,000 and 25,000 feet. (B) fly a course toward the destination which the hijacker has announced, (C) at appropriate intervals fly the international pattern for lost communication (left hand triangles), and (D) transmit the international distress signal, MAY DAY, on any of the international distress frequencies available to him (243.0 MHz, 121.5 MHz, 2182 KHz). If these procedures result in either radio contact or air intercept, the pilot will attempt to comply with any instructions received which may direct him to an appropriate landing field. Additionally, if the aircraft is equipped with an operational transponder, the pilot may use transponder Mode A (Military Mode 3) Code 7500 to indicate his aircraft has been hijacked or Code 7700 to indicate his aircraft is in distress.

7. RADIO FAILURE

Should the pilot of an aircraft equipped with a coded radar beacon transponder experience a loss of two-way radio capability he should adjust his transponder to reply on Mode A/3, Code 7600.

Pilots should understand that they may not be in an area of radar coverage. Also, many radar facilities are not presently equipped to automatically display Code 7600 and will interrogate 7600 only when the aircraft is under direct radar control at the time of radio failure. However, replying on Code 7700 first increases the probability of early detection of a radio failure condition.

8. RADAR BEACON PHRASEOLOGY

Air traffic controllers, both civil and military, will use the following phraseology when referring to operation of the Air Traffic Control Radar Beacon System (ATCRBS). Instructions by air traffic control refer only to Mode A/3 or Mode C operation and do not affect the operation of the transponder on other Modes.

SQUAWK (number) — Operate radar beacon transponder on designated code in Mode A/3.

IDENT — Engage the "IDENT" feature (military I/P of the transponder).

SQUAWK (number) AND IDENT — Operate transponder on specified code in Mode A/3 and engage the "IDENT" (military I/P) feature.

SQUAWK STANDBY — Switch transponder to standby position.

SQUAWK LOW/NORMAL — Operate transponder on low or normal sensitivity as specified. Transponder is operated in "NORMAL" position unless ATC specified "LOW" ("ON" is used instead of "NORMAL" as a master control label on some types of transponders.)

SQUAWK ALTITUDE — Activate MODE C with automatic altitude reporting.

STOP ALTITUDE SQUAWK — Turn off altitude reporting switch and continue transmitting Mode C framing pulses. If your equipment does not have this capability, turn off MODE C.

STOP SQUAWK (mode in use) — Switch off specified mode. (Use for military aircraft when the controller is unaware if a military service requires the aircraft to continue operating on another MODE.)

STOP SQUAWK — Switch off transponder.

SQUAWK MAYDAY ON 7700 — Operate transponder in the emergency position. (Mode A Code 7700 for Civil Transponder. Mode 3 Code 7700 and emergency feature for Military Transponder.)

SQUAWK VFR — Meaning, operate transponder on code 1200 regardless of altitude.

MILITARY PROCEDURES

AIR TRAFFIC CONTROL PROCEDURES

Recording and Monitoring

Calls to air traffic control (ATC) facilities (ARTCCs, Towers, FSSs, Central Flow, and Communications Control Centers) over radio and ATC operational telephone lines (lines used for operational purposes such as controller instructions, briefings, opening and closing flight plans, issuance of IFR clearances and amendments, counter hijacking activities, etc.) may be monitored and recorded for operational uses such as accident investigations, accident prevention, search and rescue purposes, specialist training and evaluation, and technical evaluation and repair of control and communications systems.

PILOT PROCEDURES WITH FAA FLIGHT SERVICE (MILITARY)

I. FLIGHTS DEPARTING "P" FIELDS

File flight plan with FAA Flight Service. If IFR within control zone or area get ARTC clearance before take-off. For those airports not within local calling distance of a FSS, leased telephone services are provided to the nearest station. One such service, Foreign Exchange (FX), permits dialing a local number which will connect to the distant FSS at the cost of a local call. Another is interphone, which is a private line extension to the nearest FSS. If neither of these services is available, call the nearest FSS by long distance collect.

NOTE: Flights departing within or proposing penetration of an ADIZ will file flight plan in writing or by telephone with an appropriate aeronautical facility prior to take-off.

II. FILING OF FLIGHT PLAN

Pilots filing flight plans or arrival reports with FAA Flight Service Station will do so by visiting or calling a FAA station. Such messages **WILL NOT** be filed with FAA control towers except when no other means of communication is available.

The following information is required for clearance from non-military airports:

- | | |
|------------------------------|------------------------------|
| 1. Type of Flight Plan. | 9. Destination |
| 2. Aircraft identification. | 10. Estimated time enroute. |
| 3. Type of aircraft/TD Code. | 11. Fuel on board. |
| 4. Estimated True Air Speed. | 12. Alternate airport. |
| 5. Departure time. | 13. Remarks. |
| 6. Cruising altitude. | 14. Pilot's name. |
| 7. Point of departure. | 15. Aircraft home base. |
| 8. Route of flight. | 16. Number of persons aboard |

NOTE: The appropriate TD Code listed below will be suffixed to the aircraft designation on DD Form 175 or FAA Form 7233-1, and/or when filing a flight plan inflight.

NO DME

- /X— No transponder
- /T— Transponder with no Mode C
- /U— Transponder with Mode C

DME

- /D— No transponder
- /B— Transponder with no Mode C
- /A— Transponder with Mode C

TACAN ONLY

- /M— No transponder
- /N— Transponder with no Mode C
- /P— Transponder with Mode C

AREA NAVIGATION (RNAV)

- /Y— LORAN, VOR/DME, or INS with no transponder
- /C— LORAN, VOR/DME, or INS, transponder with no Mode C
- /I— LORAN, VOR/DME, or INS, transponder with Mode C

ADVANCED RNAV WITH TRANSPONDER AND MODE C (If an aircraft is unable to operate with a transponder and/or Mode C, it will revert to the appropriate code listed above under Area Navigations.)

- /E— Flight Management System (FMS) with en route, terminal, and approach capability. Equipment requirements are:
 - (a) Dual FMS which meets the specifications of AC25-15, Approval of Flight Management Systems in Transport Category Airplanes; AC20-129, Airworthiness Approval of Vertical Navigations (VNAV) Systems for use in the U.S. NAS and Alaska; AC20-130A, Airworthiness Approval of Navigation or Flight Management Systems Integrating Multiple Navigations Sensors; or equivalent criteria as approved by Flight Standards.
 - (b) A flight director and autopilot control system capable of following the lateral and vertical FMS flight path.
 - (c) At least dual inertial reference units (IRU's).
 - (d) A database containing the waypoints and speed/altitude constraints for the route and/or procedure to be flown that is automatically loaded into the FMS flight plan.
 - (e) An electronic map.
 - (U.S. and U.S. territories only unless otherwise authorized.)
- /F— A single FMS with en route, terminal, and approach capability that meets the equipment requirements of /E, (a) through (d), above.
- (U.S. and U.S. territories only unless otherwise authorized.)

/G— Global Positioning System (GPS)/Global Navigation Satellite System (GNSS) equipped aircraft with en route and terminal capability.

/R— Required Navigational Performance (Denotes capability to operate in RNP designated airspace and routes.)

/W— Reduced Vertical Separation Minima (RVSM)

III. POSITION REPORTING PROCEDURE

1. IFR — Report all compulsory reporting points. Flights not conducted on airways and jet routes report over each reporting point used on the flight plan to define the route of flight.
2. VFR
 - a. FL 180 and above — report at least every 300 NM.
 - b. Below 18,000 ft MSL — report at least every 200 NM.

ADIZ PROCEDURES (MILITARY)

I. GENERAL: An Air Defense Identification Zone (ADIZ) is an airspace of defined dimensions within which certain rules for the security control of aircraft are mandatory in the interest of National Security. See below for salient operation procedures and DoD FLIP Area Planning (AP/1) for charts of the U.S. and Canadian Air Defense Identification Zones and additional procedures and details.

NOTE: In the event of the declaration of an Air Defense Emergency SECURITY CONTROL RULES will become effective. These rules are included in the published SCATANA Plan.

II. FILING OF AND ADHERENCE TO FLIGHT PLAN

A. FILING OF FLIGHT PLAN

1. When a flight penetrates or operates within an ADIZ, a DVFR (Defense Visual Flight Rules) or IFR Flight Plan will be filed in writing or by telephone with an appropriate aeronautical facility prior to takeoff. For flights originating outside an ADIZ, on other than established airways, the Remarks Section will include time, position, and altitude anticipated when penetrating the outer limits of the ADIZ. For flights entering an ADIZ or originating within an ADIZ, on other than established airways, the Remarks Section will include the time, position, and altitude within the ADIZ where the pilot anticipates turning toward land. This information should be marked "Pass to Air Defense Radar (PADRA)." Omission of or failure to update this correction information may preclude positive identification which will require intercept to confirm identity as well as filing of alleged ADIZ violation.

B. REVISION OF FLIGHT PLANS

1. No deviation will be made from a DVFR or IFR flight plan unless prior notification is given to an appropriate aeronautical facility.
2. Transmit corrected information to appropriate aeronautical facility immediately if it becomes evident that flight plan cannot be adhered to. (See next paragraph for allowable tolerances for adherence to flight plan or air traffic clearance.) The pilot will request that any revision to a flight plan, including remarks, be passed to the appropriate ARTCC and with instructions to pass to Air Defense Radar (PADRA). Failure to do so may require air defense reaction as indicated in Paragraph II. A. above.

C. ALLOWABLE TOLERANCES FOR ADHERENCE TO ADIZ FLIGHT PLAN

1. Time. Plus or minus five minutes from an estimate over a reporting point or point of penetration. Pilots departing from an airfield which has no tower facility will be required to make good a departure time within plus or minus five minutes of that proposed in the flight plan.
2. Distance. Ten nautical miles from centerline of proposed route if entering or operating within an ADIZ over land or twenty nautical miles from the centerline of proposed route if entering or operating within an ADIZ over water (to include the Aleutian Islands).
3. Altitude Deviation. None, unless an amended air traffic clearance is obtained or if operating where no air traffic clearance is required, then prior notice is given to an appropriate aeronautical facility.

D. AUTHORIZED EXCEPTIONS

1. Flights regardless of altitude operating into or within the Alaskan ADIZ at true airspeed of less than 180 knots providing such flights maintain a listening watch on the appropriate frequency.
2. Flights originating in any part of the Continental United States, except the State of Alaska, which maintains an outward bound track through the southern border ADIZ without reentering an ADIZ.
3. Flights which remain within ten nautical miles of the point of departure.
4. Flights conducted in accordance with special procedures prescribed by appropriate military authorities may be exempted on a local basis only after coordination with FAA ARTCCs and concurrence of appropriate air defense or other military commanders concerned.
5. DVFR flights without two-way radio communication may be conducted provided the flight is conducted in accordance with a filed DVFR flight plan which contains the route altitude and the estimated time to penetration and point of penetration and departure is effected within five minutes of the filed estimated time of departure.

III. ADIZ POSITION REPORT, IFR FLIGHT OUTSIDE AIR TRAFFIC CONTROL AREA AND DVFR FLIGHTS WITH TWO-WAY RADIO.

A. Penetration or inbound turn shall not be effected until a report is made of the time, position and altitude at which the aircraft passed the last reporting point prior to penetration or inbound turn and a report is provided of the estimated time of arrival over the next appropriate reporting point along the route of flight. If no reporting points are available along the route of flight, the pilot shall provide an estimate of the time, position and altitude at which he will penetrate or turn inbound. This report will be made no sooner than 30 minutes and not later than 15 minutes prior to the identification point. Position reports will be made at least once an hour while within an ADIZ unless more frequently required.

464 PROCEDURES

B. If the airport of departure is in such proximity to the ADIZ boundary to preclude compliance with the above, the pilot shall report immediately after taking off the time of departure, altitude and an estimate of the time of arrival over the first reporting point over the intended route of flight.

C. Aircraft entering the United States through an ADIZ, if so requested, shall advise the extent to which the actual time and point of penetration differed from the same data as recorded in the original ground flight plan.

NOTE: The Pilot should maintain an altitude of at least 6000 feet above the terrain while off airways unless safety of flight requires a lower altitude.

IV. RADAR ASSISTANCE WITHIN AIR DEFENSE IDENTIFICATION ZONES.

A. Emergency radar assistance is available on a 24 hour basis to identified aircraft within the limits of any Air Defense Identification Zone. The military radar system can, at the discretion of the operator, provide the following services to aircraft; track, ground speed checks, position and bearing to the nearest airport or other designated points. Canadian military assistance provides bearing in degrees true. The radar assistance provided is advisory only and does not absolve the aircraft commander of the responsibility for safe navigation of the aircraft and compliance with air traffic control clearance or other required procedures.

B. Contact the Sector Operations Control Center (SOCC) or the Region Operation Control Center (ROCC) on frequencies 121.5, 243.0 or 364.2. Frequency 364.2 is also available within the Defense Area. Example: "Radar Assistance," aircraft call sign. Subsequent calls should address the specific ROCC answering the initial call.

V. EMERGENCY PROCEDURES WITHIN ADIZ

In emergency situations, which require immediate decision and action for the safety of the flight, the pilot in command of the aircraft may deviate from the provisions of this part to the extent required for such emergency. When a deviation is exercised, the pilot in command shall report such deviation and the reasons therefore to an appropriate aeronautical facility as soon as practicable.

U.S. NAVY/U.S. ARMY USE OF RUNWAY CONDITION READINGS (RCR)

Runway condition braking action at USAF bases and certain U.S. Navy and U.S. Army Airfields is determined by the use of decelerometers. Runway condition at USAF bases is reported by ATC facilities in terms of runway condition readings (RCR). By comparing the RCR to a table in the applicable aircraft flight manual USAF pilots can determine predicted landing ground roll distances. However, similar tables are not available in the NATOPS Manuals for Naval aircraft or in Army aircraft handbooks. Accordingly, a table of equivalent is furnished to provide a convenient method of converting RCR to comparable braking action and predicted landing ground roll distances for use by Navy and Army pilots. Runway condition at U.S. Navy and U.S. Army airfields will be reported by air traffic controllers in terms of equivalent braking action as delineated in the following table.

NOTE: Joint USAF/NASA tests have proven RCR measurements invalid where the only form of moisture affecting the runway is water. Reading taken during such conditions will be reported as wet runway (WR). Measurements taken when water or slush is present on an ice covered runway will be reported as RCR 12 or the measured decelerometer reading whichever is lower.

Runway Condition Reading (RCR)	Equivalent Braking Action	% Increase in landing roll
02 to 05	Nil	100% or more
06 to 12	Poor	99% to 46%
13 to 18	Fair (Medium)	45% to 16%
19 to 25	Good	15% to 0

Runway surface conditions and RCR readings as reported by base operations are appended to hourly aviation weather observations in coded form based on the following:

Wet Runway	WR
Slush on Runway	SLR
Loose Snow on Runway	LSR
Packed Snow on Runway	PSR
Ice on Runway	IR
Patchy conditions (Ice, Snow, or Water)*	P
Runway Sanded	SANDED

*Code P will be used when the runway is less than fully covered by the coded RSC element. After patchy, a wet or dry report will be added to describe the portions of the runway not covered by ice, snow or slush.

EXAMPLES

Packed snow on runway; decelerometer reading of 15	PSR 15
Ice on runway; decelerometer reading of 05. Conditions patchy; remainder of runway wet	IROSP/WET
Loose snow on runway; decelerometer reading of 20	LSR20
Ice on runway; decelerometer reading of 05. Condition patchy, runway sanding	IROSP SANDED

NOTE: The Air Force is conducting tests to determine the actual runway condition reading (RCR) of all USAF runways under wet runway conditions. As the tests are completed, the information will be included within the Airport/Facility Remarks for each base.

NO-NOTAM PREVENTIVE MAINTENANCE PROCEDURES

NOTAM action is not required when performing routine preventive maintenance with USN facilities indicated below. Equipment will be immediately returned to operation or NOTAM action taken if weather conditions deteriorate below ceiling or visibility requirements listed. Also NOTAM action will be taken if equipment cannot be returned to operation within the specified time period.

Radio/Radar Facilities and Service	Specified Time Periods ^①	
	Days	Time (LOCAL)
Search Radar (ASR)	Sat-Sun	0800–1000
	Mon thru Fri	0200–0400
Precision Radar (PAR)	Sat-Sun	1000–1200
	Mon thru Fri	0400–0600
TACAN	Sat-Sun	1500–1600
VOR	Sat-Sun	1400–1500
LF/MF (RBn-Range)	Sat-Sun	1700–1800
LF/MF (RBn-Range)	Sat-Sun	1700–1800
ILS	Sat-Sun	1600–1700
UHF RBn	Any Day	0800–1000

① Deviations to this schedule are approved. Submit deviations via appropriate FLIP correction addressee for inclusion under Radio/Nav Remarks.

USA/USN—Locations with two or more Instrument Approach Aids, ceiling 3000', visibility 5 SM, locations with a single Instrument Approach Aid, sky condition scattered, visibility 5 SM.

USAF—Preventive Maintenance Inspection (PMI), Maintenance Period (MP) Schedules are published under applicable NAVAID, ILS/RADAR or Terminal FLIP RADAR Minima listings. Associated weather criteria, other than 3000' ceiling, 5 statute mile visibility forecast during MP plus one hour, is reported as part of the schedule. For example, (1500/3+1) where 1500 is the ceiling in feet, 3 is the visibility in statute miles and +1 (plus 1) indicates forecast during maintenance period plus one hour.

CIVIL PROCEDURES

AIR TRAFFIC CONTROL PROCEDURES

Recording and Monitoring

Calls to air traffic control (ATC) facilities (ARTCCs, Towers, FSSs, Central Flow, and Communications Control Centers) over radio and ATC operational telephone lines (lines used for operational purposes such as controller instructions, briefings, opening and closing flight plans, issuance of IFR clearances and amendments, counter hijacking activities, etc.) may be monitored and recorded for operational uses such as accident investigations, accident prevention, search and rescue purposes, specialist training and evaluation, and technical evaluation and repair of control and communications systems.

REPORTING OF MALFUNCTIONS OF NAVIGATION AIDS AND COMMUNICATIONS EQUIPMENT — FAA

1. APPLICABILITY

This special Federal Aviation Regulations applies to the operation of aircraft within Controlled Airspace under Instrument Flight Rules of Part 91 of Federal Aviation Regulations.

2. MALFUNCTION REPORTS

The pilot in command shall report immediately to Air Traffic Control any inflight malfunction of navigation or Air/Ground communications equipment as listed below:

- a. Loss of VOR, TACAN, ADF, or low frequency navigation receiver capability or,
- b. complete or partial loss of ILS receiver capability or
- c. impairment of Air Ground communications capability.
- d. Loss of airborne navigational radar.

3. SUBSTANCE OF REPORTS

Each report required under paragraph 2 hereof shall include the following:

- a. Aircraft identification.
- b. The equipment affected
- c. The degree to which capability of the pilot to operate IFR in the Air Traffic Control System is impaired and
- d. The nature and extent of assistance desired from Air Traffic Control: The exact nature and degree of assistance available from the ATC system will vary considerably. It is, therefore, essential that the pilot inform the controller of the assistance needed. If no assistance is required, normal handling may be expected. If special handling is requested, the ATC controller will provide maximum amount of assistance, consistent with the equipment at his disposal and the proper performance of his control functions with respect to other IFR aircraft. Should the circumstances warrant greater attention and priority handling with respect to other IFR aircraft, the pilot should then declare an Emergency.

FLIGHT PLAN (CIVIL)

It is strongly recommended that a flight plan be filed. This not only assures prompt search and rescue action in event you become overdue or missing, but it also permits enroute stations and the destination station to render better service by having prior knowledge of your flight. All VFR flights, whether on a flight plan or not, should make regular position reports to FAA Flight Service Stations to receive altimeter settings and weather safety advisories. Also, search and rescue action, if necessary, can be focused in the proper area. Flight Plans may be submitted to the nearest Flight Service Station either in person or by telephone. Aircraft radio may be used if no other means are available.

NOTE.— If the flight will traverse or land in one or more foreign countries, it is particularly important that pilots leave a complete itinerary with someone directly concerned, keep that person advised of the flight's progress and inform him that, if serious doubt arises as to the safety of the flight, he should first contact the FSS.

DVFR (Defense VFR) Flight Plan.— DVFR flight plans must be filed in person or by telephone. Detailed ADIZ procedures are to be found under ADIZ Procedures.

FLIGHT PLAN — IFR

1. When filing an IFR flight plan for flight in an aircraft equipped with a radar beacon transponder, DME equipment, TACAN-only equipment or a combination of both, identify equipment capability by adding a suffix to the AIRCRAFT TYPE preceded by a slant, as follows:

NO DME

- /X— No transponder.
- /T— Transponder with no Mode C
- /U— Transponder with Mode C

DME

- /D— No transponder
- /B— Transponder with no Mode C
- /A— Transponder with Mode C

TACAN ONLY

- /M— No transponder
- /N— Transponder with no Mode C
- /P— Transponder with Mode C

AREA NAVIGATION (RNAV)

/Y— LORAN, VOR/DME, or INS with no transponder

/C— LORAN, VOR/DME, or INS, transponder with no Mode C

/I— LORAN, VOR/DME, or INS, transponder with Mode C

ADVANCED RNAV WITH TRANSPONDER AND MODE C (If an aircraft is unable to operate with a transponder and/or Mode C, it will revert to the appropriate code listed above under Area Navigations.)

/E— Flight Management System (FMS) with en route, terminal, and approach capability. Equipment requirements are:

(a) Dual FMS which meets the specifications of AC25-15, Approval of Flight Management Systems in Transport Category Airplanes; AC20-129, Airworthiness Approval of Vertical Navigations (VNAV) Systems for use in the U.S. NAS and Alaska; AC20-130A, Airworthiness Approval of Navigation or Flight Management Systems Integrating Multiple Navigations Sensors; or equivalent criteria as approved by Flight Standards.

(b) A flight director and autopilot control system capable of following the lateral and vertical FMS flight path.

(c) At least dual inertial reference units (IRU's).

(d) A database containing the waypoints and speed/altitude constraints for the route and/or procedure to be flown that is automatically loaded into the FMS flight plan.

(e) An electronic map.

(U.S. and U.S. territories only unless otherwise authorized.)

/F— A single FMS with en route, terminal, and approach capability that meets the equipment requirements of /E, (a) through (d), above.

(U.S. and U.S. territories only unless otherwise authorized.)

/G— Global Positioning System (GPS)/Global Navigation Satellite System (GNSS) equipped aircraft with en route and terminal capability.

/R— Required Navigational Performance (Denotes capability to operate in RNP designated airspace and routes.)

/W— Reduced Vertical Separation Minima (RVSM)

NOTE—When filing a flight plan, use domestic or ICAO format only. If you need assistance filing your flight plan, contact the nearest FSS.

2. It is recommended that pilots file the maximum transponder or navigation capability of their aircraft in the equipment suffix. This will provide ATC with the necessary information to utilize all facets of navigational equipment and transponder capabilities available. In the case of area navigation equipped aircraft, pilots should file the /I, /R (if RNP approved), or /W (if RVSM approved) capability of the aircraft. This will ensure ATC awareness of the pilots ability to navigate point-to-point and may be utilized to expedite the flight.

NOTE — The suffix is not to be added to the aircraft identification or be transmitted by radio as part of the aircraft identification.

3. In order to provide course guidance and assist sequencing into the Anchorage Terminal Area, aircraft filed over McGrath (MCG) or Sparrevohn (SQA) and landing at Ted Stevens Anchorage International Airport or Elmendorf Air Force Base should file the following STAR's: from over MCG, file the TAGER arrival; from over SQA, file the AMOTT arrival. If unable to fly the STAR, advise ATC prior to reaching MCG or SQA for alternate instructions.

FLIGHT PLAN — VFR

Pilots are encouraged to give their departure times directly to the flight service station with which the flight plan was filed. This will ensure more efficient flight plan service and permit the FSS to advise you of significant changes in aeronautical facilities or meteorological conditions. The following procedures are in effect: when a VFR flight plan is filed, it will be held until two hours after the proposed departure time and then canceled unless:

1. The actual departure time is received.
2. A revised proposed departure time is received.
3. At a time of filing, the FSS is informed that the proposed departure time will be met, but actual time cannot be given because of inadequate communications.

CLOSING FLIGHT PLANS

VFR, and DVFR flight plans must be closed upon landing. If an arrival report is not received within a reasonable period of time after ETA, a communications search for you will be conducted. If this search fails to locate your aircraft, a Rescue Coordination Center will be advised and an extensive costly physical search for your aircraft will be inaugurated.

FLIGHT PLAN—MASTER FLIGHT PLAN PROGRAM

The master flight plan program was established for the owners/operators of aircraft in Alaska. A master flight plan is intended to record static information on an aircraft, not on a pilot. Only one master flight plan, therefore, will be accepted per aircraft from the owner/operator. Master flight plan files are maintained by Automated Flight Service Stations (AFSS's) for aircraft based within their respective area of responsibility, or Hub area. Aircraft owners/operators may file a master flight plan with an AFSS or FSS in person, via mail, phone, FAX, or radio. FSS's will forward master flight plan information to the appropriate AFSS. A master flight plan on file with any Alaskan Regional AFSS will be accepted by all Alaskan Region AFSS's/FSS's. Upon receipt of master flight plan information, the AFSS enters the information into their master flight plan file. The master flight plan becomes effective when the owner/operator is notified by the AFSS/FSS specialist. This can be accomplished either verbally upon receipt of the Master flight plan, or by other written or electronic means (fax, e-mail, phone, etc.).

Master flight plans must contain the following data:

1. Aircraft identification.
2. Aircraft type/special equipment.
3. Airspeed
4. Remarks, if any. (Radios, navigation equipment, floats, skis, other)
5. Owner or operator's name, physical address, and phone number.
6. Owner or operator's mailing address.
7. Aircraft home base, including tie-down number if available.

8. Color of aircraft.
9. Name and phone number of a 24-hour coordination contact.
10. Optional items:
 - a. Service ceiling.
 - b. Maximum fuel capacity

Aircraft owners/operators are responsible for ensuring the master flight plan information on file for their aircraft is current. Changes in master flight plan data should be reported to the appropriate facility immediately. Failure to provide updated information could cause unnecessary delays in search and rescue activities. Pilots who do not update master flight plan information may be excluded from the program.

When filing a flight plan for an aircraft with a master flight plan on file, provide the following information:

1. Type of flight plan.
2. Type of aircraft.
3. Equipment code if IFR.
4. Departure point.
5. Departure time or activation time.
6. Proposed altitude if IFR.
7. Route of flight.
8. Destination.
9. Estimated time en route.
10. Fuel on board.
11. Pilot's last name.
12. Number of people on board.

Pilots should advise where the master flight plan for the aircraft is filed when utilizing a master flight plan, i.e., "Master flight plan on file with Juneau AFSS." The additional information required for search and rescue will be obtained from the facility holding the master flight plan file in the event the aircraft becomes overdue.

ATC IFR CLEARANCE DELIVERY

a. At airports where a traffic control tower is in operation, ATC IFR clearances are normally relayed to pilots on the "ground control" frequency or on a published "clearance delivery" frequency.

b. At airports where a Flight Service Station is in operation or having a part-time Flight Service Station with a remote communications outlet (RCO), ATC IFR clearances shall be obtained through the FSS on the common traffic advisory frequency (CTAF).

c. At airports where there is neither a control tower nor an FSS, but there is a remote communications Air-Ground Facility (RCAG) available, contact the ARTCC direct. (Frequencies are published on Enroute Charts and in the Airport/Facility directory of this supplement.)

d. At airports where there is no control tower, FSS, RCO, or RCAG, a clearance may be obtained through the nearest FSS, or RCAG.

Air Defense Identification Zone (ADIZ) Procedures (Civil)

Recommended ADIZ Practices. — No person may operate an aircraft in or penetrating an ADIZ unless he has filed a flight plan with an appropriate Aeronautical facility. The North American Aerospace Defense Command advises that an "Airfiled" flight plan makes the aircraft subject to interception for positive identification. Pilots are strongly urged, therefore, to file DVFR Flight Plans required for Security Control either in person or by telephone. To encourage conformance with this request FAA Flight Service Stations will accept collect long distance telephone calls made for the purpose of filing required DVFR flight plans. The following procedure will apply.

1. Contact the long distance telephone operator and place a collect, station-to-station call for "SECURITY PILOT (your last name)" to the FAA station.

2. When the FAA station accepts the call, file your DVFR flight plan as expeditiously as possible.

FAA stations will not accept collect calls from locations which are obviously much closer to another FAA station, neither will they accept calls which do not contain the key words "SECURITY PILOT (name)." In order to conserve government funds, FAA station will not accept long distance collect calls from any pilot within the Defense Area. DVFR flight plans from such points will be accepted, however, if filed at no expense to the government.

ADIZ Transponder Requirements — All civil aircraft equipped with an operable radar beacon transponder must be operated with that transponder turned on, including the altitude encoder if installed, and reply on the appropriate code or on a code assigned by ATC.

Emergency Security Control of Air Traffic (ESCAT)

http://www.access.gpo.gov/nara/cfr/waisidx_07/32cfr245_07.html

The ESCAT plan (see 32 CFR Part 245) defines the authorities, responsibilities, and procedures to identify and control air traffic within a specified air defense area during air defense emergencies, defense emergency, or national emergency conditions. ESCAT provides the security control of both civil and military air traffic. It is intended to meet threat situations such as an emergency resulting in the declaration of an Air Defense Emergency by the appropriate military authority or other emergency conditions that either threaten national security or national interests vital to the U.S., but do not warrant declaration of Defense Emergency or Air Defense Emergency.

When ESCAT is implemented, a system of traffic priorities may be required to make optimum use of airspace, consistent with air defense requirements. The ESCAT Air Traffic Priority List (EATPL) is a list of priorities that may be used for the movement of air traffic in a defined area. The originator of an aircraft flight operation under the EATPL shall be responsible for determining and verifying that the mission meets the appropriate definition and priority, and ensuring a security check* of the crew, cargo and aircraft has been completed prior to takeoff. The individual filing the flight plan will be responsible for

including the priority number as determined by the originator of the aircraft flight operation, in the remarks section of the flight plan.

*NOTE: Security checks must be in accordance with the Transportation Security Administration directives.

The appropriate military authority will: (a) notify or coordinate, as appropriate, the extent or termination of ESCAT implementation with DOT and DHS; (b) disseminate the extent of ESCAT implementation; (c) specify what restrictions are to be implemented; and (d) revise or remove restrictions on the movement of air traffic as the tactical situation permits.

The FAA Air Traffic Control System Command Center (ATCSCC) will direct appropriate ARTCCs/CERAPs to implement ESCAT restrictions as specified by the appropriate military authority.

U.S. civil and military air traffic control facilities will: (a) maintain current information on the status of restrictions imposed on air traffic; (b) process flight plans in accordance with current instructions received from the ARTCC (All flights must comply with the airspace control measures in effect, the EATPL, or must have been granted a Security Control Authorization); and (c) disseminate instructions and restrictions to air traffic as directed by the ARTCCs.

INTERCEPTION SIGNALS ICAO STANDARD

SIGNALS INITIATED BY INTERCEPTING AIRCRAFT AND RESPONSES BY INTERCEPTED AIRCRAFT

SERIES	INTERCEPTING AIRCRAFT SIGNALS	MEANING	INTERCEPTED AIRCRAFT RESPONSE	MEANING
1	<p>AIRPLANES: DAY—Rocking wings from a position slightly above and ahead of, and normally to the left of, the intercepted aircraft and, after acknowledgement, a slow level turn, normally to the left, on to the desired heading.</p> <p>NIGHT—Same and, in addition, flashing navigational lights at irregular intervals.</p> <p>NOTE 1.—Meteorological conditions or terrain may require the intercepting aircraft to take up a position slightly above and ahead of, and to the right of, the intercepted aircraft and to make the subsequent turn to the right.</p> <p>NOTE 2.—If the intercepted aircraft is not able to keep pace with the intercepting aircraft, the latter is expected to fly a series of race-track patterns and to rock its wings each time it passes the intercepted aircraft.</p>	<p>You have been intercepted. Follow me.</p>	<p>AIRPLANES: DAY—Rocking wings and following.</p> <p>NIGHT—Same and, in addition, flashing navigational lights at irregular intervals.</p> <p>HELICOPTERS: DAY or NIGHT—Rocking aircraft, flashing navigational lights at irregular intervals and following.</p>	<p>Understood, will comply.</p>
2	<p>DAY OR NIGHT—An abrupt breakaway maneuver from the intercepted aircraft consisting of a climbing turn of 90 degrees or more without crossing the line of flight of the intercepted aircraft.</p>	<p>You may proceed.</p>	<p>AIRPLANES: DAY or NIGHT—Rocking wings.</p> <p>HELICOPTERS: DAY or NIGHT—Rocking aircraft.</p>	<p>Understood, will comply.</p>
3	<p>DAY—Circling aerodrome, lowering landing gear and overflying runway in direction of landing or, if the intercepted aircraft is a helicopter, overflying the helicopter landing area.</p> <p>NIGHT—Same and, in addition, showing steady landing lights.</p>	<p>Land at this aerodrome.</p>	<p>AIRPLANES: DAY—Lowering landing gear, following the intercepting aircraft and, if after overflying the runway landing is considered safe, proceeding to land.</p> <p>NIGHT—Same and, in addition, showing steady landing lights (if carried).</p> <p>HELICOPTERS: DAY or NIGHT—Following the intercepting aircraft and proceeding to land, showing a steady landing light (if carried).</p>	<p>Understood, will comply.</p>

**SIGNALS INITIATED BY INTERCEPTING AIRCRAFT AND
RESPONSES BY INTERCEPTED AIRCRAFT**

SERIES	INTERCEPTING AIRCRAFT SIGNALS	MEANING	INTERCEPTED AIRCRAFT RESPONSE	MEANING
4	DAY—Raising landing gear while passing over landing runway at a height exceeding 300m (1,000 ft) but not exceeding 600m (2,000 ft) above the aerodrome level, and continuing to circle the aerodrome.	Aerodrome you have designated is inadequate.	DAY OR NIGHT—If it is desired that the intercepted aircraft follow the intercepting aircraft to an alternate aerodrome, the intercepting aircraft raises its landing gear and uses the Series 1 signals prescribed for intercepting aircraft.	Understood, follow me
	NIGHT—Flashing landing lights while passing over landing runway at a height exceeding 300m (1,000 ft) but not exceeding 600m (2,000 ft) above the aerodrome level, and continuing to circle the aerodrome. If unable to flash landing lights, flash any other lights available.		If it is decided to release the intercepted aircraft, the intercepting aircraft uses the Series 2 signals prescribed for intercepting aircraft.	Understood, you may proceed.
5	AIRPLANES: DAY or NIGHT—Regular switching on and off of all available lights but in such a manner as to be distinct from flashing lights.	Cannot comply.	DAY or NIGHT—Use Series 2 signals prescribed for intercepting aircraft.	Understood.
6	AIRPLANES: DAY or NIGHT—Irregular flashing of all available lights. HELICOPTERS: Day or Night—Irregular flashing of all available lights.	In distress.	DAY or NIGHT—Use Series 2 signals prescribed for intercepting aircraft.	Understood.

DISTRESS INTERCEPTION SIGNALS

SIGNAL BY INTERCEPTED AIRCRAFT	MEANING	RESPONSE BY INTERCEPTOR
DAY—Porpoising NIGHT—Switching on landing lights and holding steady beam.	In Distress	DAY OR NIGHT—Use appropriate interception signals as shown above.

NOTE TO INTERCEPTION SIGNALS
(See preceding page)

The word "interception" in this context does not include intercept and escort service provided, on request, to an aircraft in distress.

An aircraft which is intercepted by another aircraft shall immediately:

- a. follow the instructions given by the intercepting aircraft, interpreting and responding to visual signals on preceding page;
- b. notify, if possible, the appropriate air traffic services unit;
- c. attempt to establish radio communication with the intercepting aircraft or with the appropriate intercept control unit, by making a general call on the emergency frequency 243.0, MHz and repeating this call on the emergency frequency 121.5 MHz, if practicable, giving the identity and position of the aircraft and the nature of the flight;
- d. if equipped with SSR transponder select Mode 3/A Code 7700, unless otherwise instructed by the appropriate air traffic services unit.

If any instructions received by radio from any sources conflict with those given by the intercepting aircraft by visual or radio signals, the intercepted aircraft shall request immediate clarification while continuing to comply with the instructions given by the intercepting aircraft.

ATTENTION: ICAO Standard Interception Signals are applicable in all areas with exceptions as published below.

RUSSIA

1. The following rules are applicable to foreign aircraft operating within Russian airspace in accordance with previously issued clearances or existing overflight agreements. The Aeronautical Information Publication (AIP) as published by the Ministry of Civil Aviation, CIS, contains the Soviet Rules for Engagement. These rules are applicable to foreign aircraft operating with Russian airspace in accordance with previously issued clearances or existing overflight agreements. Foreign aircraft, flying in the air space of Russia, violating established flight procedures, or not complying with commands of the Air Traffic Control Service of the Ministry of Civil Aviation directing the flight of that aircraft, will be considered violators and alert aircraft of the Anti-Air Defense will compel them to land at the nearest airport.

NAVIGATION WARNING

U.S. aircraft flying between Alaska and Japan are cautioned of the absolute necessity of remaining over international waters at all times in order to avoid possibly dangerous consequences which could result from unauthorized overflight of Russian territory. Recognition that many flight tracks on this route provide minimum separation from Russian airspace further emphasizes the need for all pilots to use all existing navigational capability. It is therefore recommended that all pilots flying between Alaska and Japan take utmost precautions to avoid flying over Russian territory.

**INTERFERENCE WITH INTERNATIONAL SEARCH
AND RESCUE SATELLITE (SARSAT)**

Keying either 121.5 MHZ or 243.0 MHZ for 30 seconds or more will activate the SARSAT. Any activation initiates ground processing to locate the activating transmitter. Historically, inadvertent activations have been inordinately high and cause false alarms which seriously degrade the efficiency of the SAR System. Transmissions on 243.0 and 121.5 must not exceed a 15-second keying limit except in actual emergency or distress situations.

SEARCH PROCEDURES EMERGENCY LOCATOR TRANSMITTER (ELT)

Locating the Position of a VHF or UHF ELT. — The initial search for survivors equipped with a VHF or UHF ELT will be at high altitude to take advantage of the increased range afforded by altitude. The receiver should be tuned to the frequency of the ELT with squelch off. The frequency should be guarded aurally and visually if the search aircraft has suitable homing equipment. While some progress is being made toward standardization on the type of signal emitted by these survival ELTs, search and rescue personnel should realize that complete standardization may not be achieved in the near future. If the type of signal emitted by the particular ELT is not known, searchers should be alert for any signal on the frequency, including a steady tone. Types of signals used by these ELTs are: steady tone (this may become a warbling tone if the ELT is floating in the ocean); a definite warbling tone built into the ELT; and interrupted tone (a peculiar “beep-beep-beep”) built into the ELT.

Once the ELT signal is detected, it will be a simple matter for the search aircraft to home on it, if the aircraft is equipped with homing equipment. However, if the search aircraft has only receiver capability, it can still locate the survivors by flying one of the two procedures described below:

SEARCH PATTERN PROCEDURE (Boxing-in)

Boxing-in patterns assume that the lines of equal signal strength will be circular, as shown below. Thus, an aircraft flying at constant altitude can determine the limits of successive chords to the equal signal strength circle corresponding to a barely audible signal on its own receiver by plotting its position as the signal appears and again when it fades. The perpendicular bisector of each chord is an approximate line of position containing the beacon. The intersection of any 2 lines of position will indicate the approximate location of the beacon and the aircraft will be able to proceed to the approximate position. By proceeding to this position and descending to appropriate altitude, the aircraft can then make another low-level boxing-in pattern and/or carry out a close visual search for the survivors by any convenient high probability visual search pattern.

EQUAL SIGNAL STRENGTH CIRCLE

2. SEARCH PATTERN PROCEDURE (180°-90° Build-Fade Method)

After the emergency signal is received and identified, the volume should be decreased to the lowest level that can be clearly identified. As the signal increases, the volume control should be reduced accordingly.

By using the 180°-90° (build and fade) search pattern, an ELT signal can be successfully located within a 4 to 10 square mile area, and many times pin point the site of the ELT.

Search pattern procedure (180°-90° turn pattern)

1. Aurally identify the ELT signal.
2. Note the signal level (loudness).
3. Hold constant heading and altitude while recording your location on appropriate chart.
4. Record relative signal levels and position on chart at periodic intervals.
5. a. After first detecting the emergency signal, two situations may be encountered relative to the change in signal level received. The two conditions are listed below:
 - (1) **FADE** —The emergency signal level diminishes as the search aircraft maintains a constant course (heading away from ELT).
 - (2) **BUILD** —The emergency signal steadily increases in signal strength as the search aircraft continues on course (flying toward the ELT).
- b. The search aircraft should be flown through the area of maximum signal level and continue to the point of signal fade-out.
6. Execute 180° turn and return to the point of highest signal level.
7. At the point of highest signal level execute a 90° turn to the right or left.
8. If the signal diminishes, conduct an 180° turn and return toward maximum signal location (on chart).
9. After passing over the area of highest signal level, maintain heading until a definite decrease in signal level is obtained.
10. Execute a 180° turn and return to the point of highest signal level for approximate ELT location.
11. It may be necessary to repeat steps 7 through 10 several times to accurately locate the ELT.

NOTE: A cone of silence may be experienced directly over the ELT at low altitudes, thus indicating the location of the ELT.

NUMBERS REPRESENT VALUES OF SIGNAL STRENGTH.
THE HIGHER THE NUMBER, THE STRONGER THE SIGNAL.

SEARCH AND RESCUE**1. GENERAL**

a. Search and Rescue is a life-saving service provided through the combined efforts of the FAA, Military Services, Coast Guard, State Boards, Aeronautic Commissions or other similar state agencies who are assisted by other organizations such as the Civil Air Patrol, Sheriffs Air Patrol, State Police, etc. It provides search, survival aid, and rescue of personnel of missing or crashed aircraft.

b. Prior to departure on every flight, local or otherwise, someone at the departure point should be advised of your destination and the route of flight if other than direct. Search efforts are often wasted and rescue is often delayed because of pilots who thoughtlessly take off without telling anyone where they are going.

c. All you need to remember to obtain this valuable protection is:

- (1) File a Flight Plan with an FAA Flight Service Station in person or by telephone or radio.
- (2) Close your flight plan with the appropriate authority immediately upon landing.
- (3) If you land at a location other than the intended destination, report the landing to the nearest FAA Flight Service Station.

(4) If you land enroute and are delayed more than 30 min., report this information to the nearest FSS.

(5) Remember that if you fail to report within one-half hour after your ETA, a search will be started to locate you.

d. If a crashed aircraft is observed:

- (1) Determine if crash is marked with yellow cross; if so, crash has already been reported and identified.
- (2) Determine, if possible, type and number of aircraft and whether there is evidence of survivors.
- (3) Fix, as accurately as possible, exact location of crash.
- (4) If circumstances permit, orbit scene to guide in other assisting units relieved by another aircraft.
- (5) Transmit information to nearest FAA or other appropriate radio facility.
- (6) Immediately after landing, make a complete report to nearest FAA, Air Force, or Coast Guard installation. Report may be made by long distance collect telephone.

e. To assist survival and rescue in the event of a crash landing the following advice is given:

(1) For flight over uninhabited land areas, it is wise to take suitable survival equipment depending on type of climate and terrain.

(2) If forced landing occurs at sea, chances for survival are governed by degree of crew proficiency in emergency procedures and by effectiveness of water survival equipment.

(3) If it becomes necessary to ditch, distressed aircraft should make every effort to ditch near a surface vessel. If time permits, the position of the nearest vessel can be obtained from a Coast Guard Rescue Coordination Center through the FAA facility.

(4) The rapidity of rescue on land or water will depend on how accurately your position may be determined. If flight plan has been followed and your position is on course, rescue will be expedited.

(5) Unless you have good reason to believe that you will not be located by search aircraft, it is better to remain near your aircraft and prepare means for signalling whenever aircraft approach your position.

f. Search and Rescue facilities include:

- (1) Rescue Coordination Centers;
- (2) Search and Rescue aircraft;
- (3) Rescue vessels;
- (4) Pararescue and ground rescue teams;
- (5) Emergency radio fixing.

2. CLOSE YOUR FLIGHT PLAN

a. The control tower does not automatically close VFR flight plans since many of the landing aircraft are not operating on flight plans. It remains the responsibility of a pilot to close his own flight plan. This will prevent a needless search.

3. NATIONAL SEARCH AND RESCUE PLAN

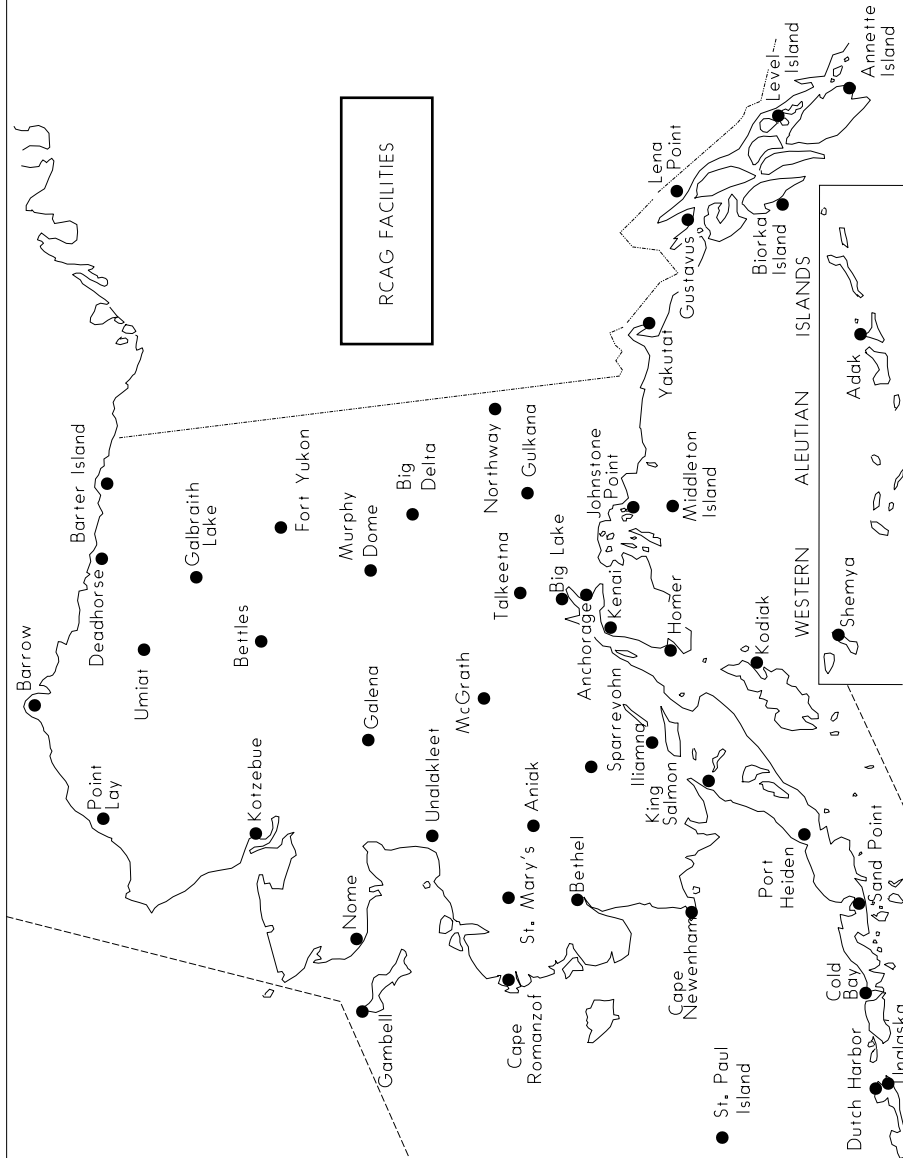

a. Under the National Search and Rescue Plan, the U.S. Coast Guard is responsible for coordination of search and rescue for the Maritime Region, and the U.S. Air Force is responsible for coordination of search and rescue for the CONUS-Inland Region, and the Unified Commander for the coordination of search and rescue for the overseas theaters (Alaska). In order to carry out this responsibility the Air Force, the Coast Guard and Unified Commanders have established Rescue Coordination Centers to direct search and rescue activities within their regions. This service is available to all persons and property in distress, both civilian and military. Normally, for aircraft incidents, information will be passed to the Rescue Coordination Centers through the appropriate Air Route Traffic Control Center or Flight Service Station.

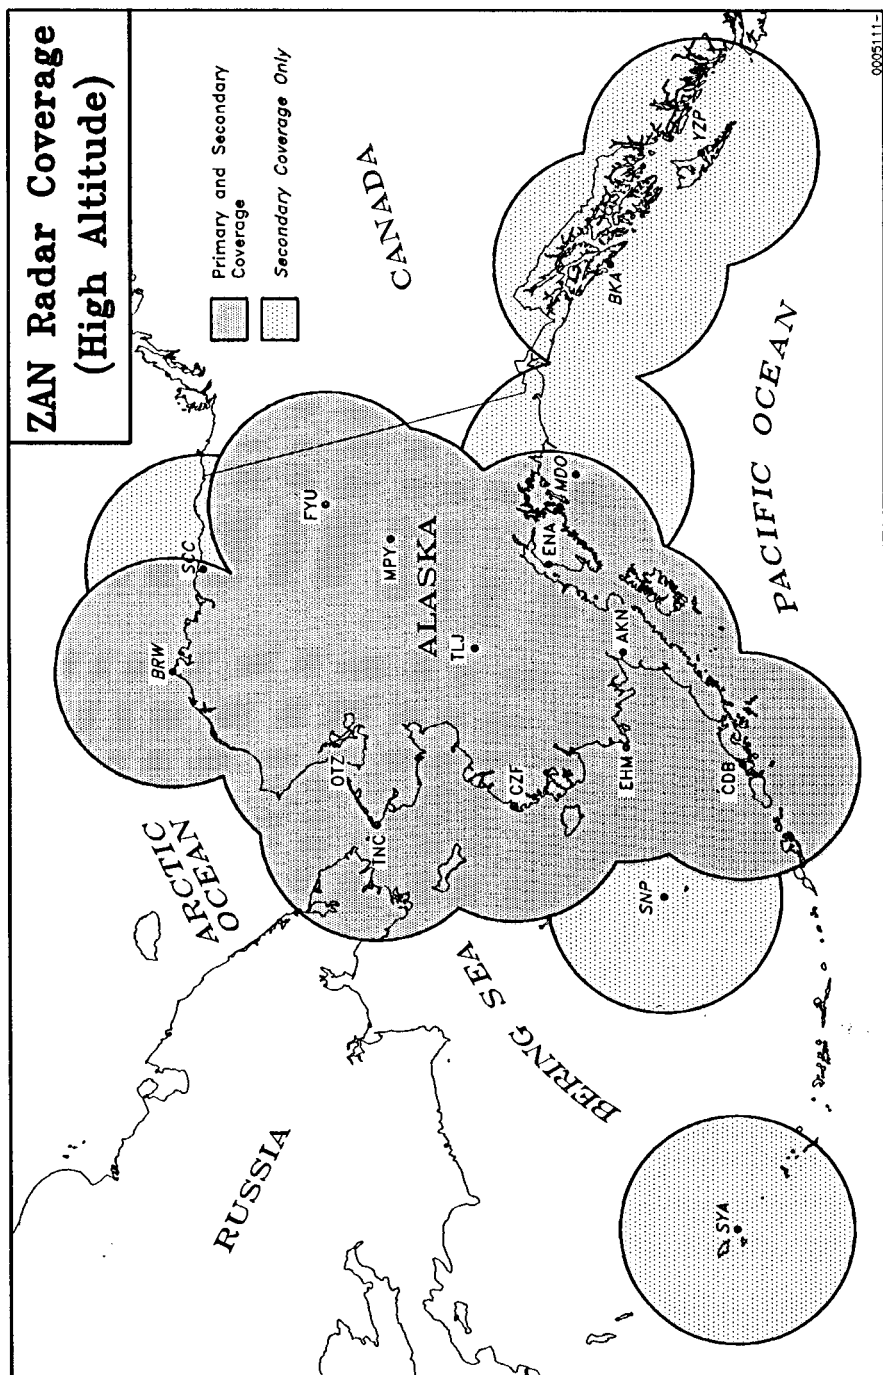

4. INADVERTENT OPERATION OF EMERGENCY LOCATOR TRANSMITTERS

In addition to depleting the batteries, accidental triggering of ELTs or improper test procedures could cause an unnecessary search. The on/off switch should be checked prior to and upon completion of each flight, and the ELT should be stored in a secure place until needed.

SEARCH AND RESCUE

The map below shows the location of remote transceivers (called RCAGs) in Alaska. They are used by Air Traffic Control for IFR operations. Aircraft in an emergency and unable to communicate in the normal way could contact overflying aircraft and ask them to relay messages. Example: If you are in the Galbraith Lake area, IFR aircraft will be monitoring the Galbraith RCAG. All RCAG frequencies are listed under Anchorage Center.

COAST GUARD RESCUE COORDINATION CENTERS

(Operates 24 hours a day)

Juneau

800-478-5555 907-463-2000

Coast Guard Rescue Coordination Centers are served by major radio stations which guard 500 kHz (CW), 8364 kHz (CW), and 2182 kHz (Voice). In addition to the major radio stations, the 247 Coast Guard units along the sea coasts of the United States and shores of the Great Lakes guard 2182 kHz (Voice). All of these facilities are available for reporting distress or potential distress. THE CALL "NCU" (CW) or "COAST GUARD" (VOICE) ALERTS ALL COAST GUARD RADIO STATIONS WITHIN RANGE.

AIR FORCE RESCUE COORDINATION CENTER

(Operates 24 hours a day)

Anchorage, AK

1-800-420-7230

11th Rescue Coordination Center monitors 123.1, 282.8 and 5710 HF.

FUEL JETTISONING

1. Should it become necessary to jettison fuel, the pilot should immediately advise Air Traffic Control. Upon receipt of advice that an aircraft will jettison fuel, Air Traffic Control will broadcast or cause to be broadcast at a reasonable time before fuel dumping is to begin and every 3 minutes thereafter on appropriate Air Traffic Control, Flight Service Station and airline company radio frequencies the following:

ADVISORY TO AIRCRAFT NOT ON ATC CLEARANCE—FUEL DUMPING IN PROGRESS—(aircraft type) (present position) (course/s) (altitude)—AVOID FLIGHT WITHIN 10 NAUTICAL MILES IF AT THIS ALTITUDE. IF WITHIN FIVE NAUTICAL MILES, REMAIN AT LEAST ONE THOUSAND FEET ABOVE OR AT LEAST TWO THOUSAND FEET BELOW THE AIRCRAFT.

2. Upon receipt of such a broadcast, pilots of aircraft affected, which are not on IFR flight plans or special VFR clearances, should clear the area specified in the advisory. Aircraft on IFR flight plans or special VFR clearances will be provided specific separation by Air Traffic Control. At the termination of the fuel jettisoning operation, pilots should advise Air Traffic Control. Upon receipt of such information, Air Traffic Control will issue, on appropriate frequencies, the following:

ADVISORY TO ALL CONCERNED—(aircraft type) FUEL DUMP TERMINATED.

EMERGENCY PROCEDURES**GENERAL****I. PROCEDURE FOR TWO-WAY RADIO FAILURE IFR—VFR****IFR FLIGHT PLAN**

Two-way radio failure and circumstances surrounding them are so varied that exact rules to be followed cannot be established. However, the following procedures are those which the pilot will be expected to observe in order that ATC can effect the safe control of air traffic AND ARE APPLICABLE TO ALL TYPES OF AIRCRAFT. During two-way radio communications failure, when confronted with a situation not covered in the regulation, pilots are expected to exercise good judgment in whatever action they elect to take. Should the situation so dictate, they should not be reluctant to use the emergency action contained in flying regulations.

Should the pilot of an aircraft equipped with a coded radar beacon transponder experience a loss of two-way radio capability he should adjust his transponder to reply on Mode A/3, Code 7600.

The pilot should understand that he may not be in an area of radar coverage. Many radar facilities are also not presently equipped to automatically display Code 7600 and will interrogate 7600 only when the aircraft is under direct radar control at the time of radio failure. However, replying on code 7700 first increases the probability of early detection of a radio failure condition. Pilots can expect ATC to attempt to communicate by systematically transmitting on suitable air/ground radio frequencies as well as on the voice feature of all available radio navigational or approach aids. If two way radio communications are lost with an aircraft under radar control, ATC will request the pilot to acknowledge in accordance with one of the following as appropriate.

- Reply with the Mode 3 ident feature.
- Changing to a specified Mode 3 code or
- Changing transponder to STANDBY for sufficient time for the controller to be assured that lack of a target is due to the requested change; or
- When the aircraft is not equipped with a functioning transponder; by executing specified turns.

A. VFR CONDITIONS

If able to maintain flight in VFR conditions continue flight under VFR and land as soon as practicable and notify ATC. It is not intended that the requirement to "land as soon as practicable" be construed to mean "as soon as possible". The pilot retains his prerogative of exercising his best judgment and is not required to land at an unauthorized airport, at an airport unsuitable for the type of aircraft flown, or to land only minutes short of his intended destination. The primary objective of this provision, is to preclude extended IFR operations in the air traffic control system in VFR weather conditions. When operating "ON TOP" and unable to descend VFR prior to the destination, the procedures contained in paragraph B below apply.

480 EMERGENCY PROCEDURES

B. IFR Conditions

If the failure occurs in IFR conditions, or if VFR conditions are not encountered after the failure or paragraph A cannot be complied with, each pilot shall continue the flight according to the following:

1. ROUTE

- a. By the route assigned in the last ATC clearance received;
- b. If being radar vectored by the direct route from the point of radio failure to the fix, route, or airway specified in the vector clearance.
- c. In the absence of an assigned route, by the route that ATC has advised may be expected in a further clearance; or
- d. In the absence of an assigned route or a route that ATC has advised may be expected in a further clearance, by the route filed in the flight plan.

2. ALTITUDE

At the highest of the following altitudes or flight levels for the route segment being flown.

- a. The altitude or flight level assigned in the last ATC clearance received;
- b. Where appropriate, the minimum altitude/flight level. The minimum flight level is determined by adding the adjustment factor based on the current reported altimeter setting (shown below) to the minimum altitude for that segment.

ALTIMETER SETTING (Current Reported)	LOWEST USABLE FLIGHT LEVEL	ADJUSTMENT FACTOR
29.92 or higher	180	None
29.91 to 29.42	185	500 ft
29.41 to 28.92	190	1000 ft
28.91 to 28.42	195	1500 ft
28.41 to 27.92	200	2000 ft
27.91 to 27.42	205	2500 ft
27.41 to 26.92	210	3000 ft

- c. The altitude or flight level ATC has advised may be expected in a further clearance.

3. Leave Clearance Limit/Holding Fix

If a clearance limit/holding fix has been assigned, leave the clearance limit/holding fix at the expect-further clearance (EFC) time received; or, if an expect-approach-clearance (EAC) has been received, leave the clearance limit/holding fix in order to arrive over the fix from which the approach begins as close as possible to EAC time. If no EAC or EFC has been received, continue to the facility/fix serving the destination airport at the last assigned altitude or minimum enroute altitude (MEA), which ever is higher.

4. Descent For Approach

Begin descent from the enroute altitude or flight level upon reaching the fix from which the approach begins, but not before —

- a. The expected-approach-clearance time (if received); or
- b. If no expected-approach-clearance time has been received—at the estimated time of arrival, derived from the estimated time filed in the flight plan, or as amended with ATC.

5. Pilots of aircraft equipped with coded radar beacon transponders may alert ATC of their radio failure by adjusting their transponder to reply on Mode 3/A, Code 7600.

6. Holding

If holding is necessary at the radio facility/fix to be used for the approach at the destination airport, holding and descent to the initial approach altitude or initial penetration Altitude Flight Level for the execution of the penetration and/or instrument approach shall be accomplished in a holding pattern in accordance with the procedure depicted on the Approach and Landing Chart or Jet Approach and Landing Chart for the airport. If no holding pattern is depicted, holding and descent will be accomplished in a holding pattern on the side of the final approach course to the fix on which the procedure turn is prescribed.

C. SPECIAL MILITARY PROCEDURES

1. Aircraft, on a flight in which a delay enroute is planned, shall commence descent at the destination, at the estimated time of arrival (ETA) derived from the estimated time enroute (ETE) plus any delay for which an ATC clearance has been obtained.

EXAMPLE NO. 1. Point-to-point flight plan, from A to B to C to D (airport of destination). Estimated elapsed time enroute specified in flight plan is three hours (A to D). Remarks indicate proposed two hours local flight at B and one hour local flight at C. On departure, flight is cleared to D (or a short-range clearance limit). If radio communications failure is experienced prior to reaching B, flight should proceed to destination in accordance with established radio communications failure procedures. If the flight has obtained an amended clearance, authorizing a two-hour delay at B, and experiences radio communications failure prior to reaching B or after local flight is begun, local flight at B will be completed. Local flight at C will not be executed.

EXAMPLE NO. 2. Round Robin flight plan from Point A to B to C and back to A. Estimated elapsed time enroute specified in flight plan is three hours (A to A). Remarks indicate one-hour local flight at B and one-hour local flight at A prior to landing. Action governing delay at B would be as indicated in Example No. 1. If the flight is cleared for local flight at A and subsequently experiences radio communications failure, local flight will be completed before beginning letdown.

2. Aerial Refueling

A. Tanker aircraft which have not received altitude instructions beyond the exit point should exit the Track or Anchor at the **highest** altitude in the clearance for the refueling portion of the flight and proceed in accordance with the radio communications failure procedures.

B. Receiver aircraft which have not received altitude instructions beyond the exit point should exit the Track or Anchor at the **lowest** altitude specified in the clearance for the refueling portion of the flight and proceed in accordance with radio communications failure procedures.

3. Turbojet Enroute Descent

When a two-way communications failure is experienced during an enroute descent, proceed to the initial approach fix/radio facility to be used for the approach at destination and execute the published approach. The altitude to be maintained, and from which the approach is to be executed, is the highest of the following:

- a. The last assigned altitude.
- b. The minimum safe altitude.
- c. The emergency safe altitude if the point of communications failure or initial approach fix is more than 25 miles from the navigation facility for the approach.

VFR FLIGHT PLAN

Radio Failure While On A VFR Flight Plan — In the event of two-way radio failure between the aircraft and the ground while operating on a VFR flight plan, the pilot will land at originally filed destination or a suitable airfield, military or civil, before reaching destination. Flight plan may not be extended past the original destination except in emergency.

II. VISUAL SIGNALS WHEN AIRCRAFT RADIO INOPERATIVE

A. DAY VISUAL SIGNALS

1. DESCEND TO LOWER ALTITUDE: Hold hand at top of canopy, palm down, fingers extended and joined, move hand forward and down.
2. FUEL CHECK: Close fist with the thumb extended and perform drinking motion with thumb touching the oxygen mask.
3. FUEL REMAINING: Extend one finger for each 1,000 lbs. of fuel on board. Extend finger(s) vertically for 1,000-5,000 lbs; horizontally for 6,000-9,000 lbs. After signalling 1,000 lb. increments, close fist and signal 100-lb. increments in the same manner. Signal zero with closed fist.

EXAMPLE 1: To signal 6,600 lbs., extend one finger horizontally (indicating 6,000 lbs.); then close fist (indicating a change from thousands to hundreds) and extend one finger horizontally (indicating 600 lbs.).

EXAMPLE 2: To signal 13,800 lbs., extend one finger vertically, then three fingers vertically (indicating 13,000 lbs.); then close fist and extend three fingers horizontally (indicating 800 lbs.).

EXAMPLE 3: If the pilot is operating with NATO forces and is so briefed, signal estimated flying time by extending one finger for each ten minutes and a closed hand to indicate one hour, i.e., to indicate one hour and thirty minutes flying time, signal three fingers and a clenched fist.

4. HEFOE SYSTEM: Clench fist and hold it at top of canopy, then hold up the required number of fingers to denote which system is involved (see (1) through (5) below). The receiving pilot acknowledges the signal by repeating it.
 1. Hydraulic — one finger.
 2. Electrical — two fingers.
 3. Fuel — three fingers.
 4. Oxygen — four fingers.
 5. Engine — five fingers.
5. I MUST LAND ON YOUR WING: Pat shoulder, palm down; use right hand for left shoulder, and vice versa, to prevent confusion with other signals. To acknowledge, other pilot must give an OK signal; the basic signal indicates a jet approach speed of 130 knots. If the distress aircraft desires a higher approach, speed, the pilot must raise one finger for each 10-knot increase desired.
6. LAND IMMEDIATELY: Close fist and hold it to top of canopy, with thumb extended downward, then move arm up and down rapidly. (Do not confuse this signal with "GEAR DOWN" signal, which is not used at altitude.)
7. RADIO INOPERATIVE: Fly aircraft along the side of the landing runway, 1000 feet above the field elevation, rocking wings until it reaches end of the runway. Turn to downwind and check mobile control and/or tower for green light on base leg and final approach.
8. RECEIVER FAILURE: With palm of hand over ear position, move hand forward and backward.
9. TRANSMITTER FAILURE: With palm of hand toward and in front of the face, pilot moves hand up and down.

B. NIGHT VISUAL SIGNALS

1. AIRCRAFT EMERGENCY (MUST LAND AS SOON AS POSSIBLE): Signal escort aircraft by describing a circle on the side of the canopy with a flashlight, then get on the man's wing—this signal indicates a jet approach speed of 130 knots. If a higher approach speed is desired, the pilot must pause after the basic signal, and then blink his flashlight at the top of the canopy, once for each 10 knot increase desired. The escort pilot will lead to the nearest suitable field, declare an emergency with the controlling agency, then fly a straight-in approach with the aircraft on his wing. The distressed aircraft lands and the escort executes a go-around.

NOTE: On a straight-in approach, the escort aircraft turns his position lights to bright and steady to alert the wingman to prepare to lower flaps and landing gear. The corresponding signal of execution will be for the lead escort aircraft to return his position lights to dim and steady. If the aircraft is equipped only with a steady-bright light position, however, it will blink lights for the alerting signal and for the signal of execution.

482 EMERGENCY PROCEDURES

2. **AIRCRAFT HAVING MINOR DIFFICULTIES:** The distressed aircraft will signal another aircraft in the formation by signaling a series of flashes from a flashlight, then get on the man's wing. The basic airspeeds and flight procedures are the same as specified for "Aircraft Emergency" above, except that the escort will lead to the intended landing field and will not declare an emergency in doing so.
3. **CHANGE LEAD:** Pilot of distressed aircraft holds flashlight parallel with canopy rail and sends a steady light while making a straight line from rear toward the front of the canopy.
4. **COMPLETE ELECTRICAL FAILURE (NO ASSIST AIRCRAFT AVAILABLE):** Distressed aircraft flies 500 feet over mobile control or tower, thoroughly checking for other aircraft in the area. Flies to the far end of the runway, pulls up into a downwind leg, and proceeds with a normal landing; while watching mobile or tower for signals. The control tower will clear the area of other aircraft, and will call the emergency crash equipment to the scene.
5. **DESCENT TO LOWEST PRACTICAL ALTITUDE:** The pilot makes a rapid vertical movement with a flashlight.
6. **RADIO FAILURE:** Same as day signal procedure.
7. **SIGNAL ACKNOWLEDGEMENT:** Point a steady light from the flashlight at the signaling aircraft.

III. U. S. COAST GUARD SHORE STATIONS MAINTAINING WATCH ON 8364 kHz

The following Coast Guard radio stations listen on the 8 MHz ship radio telegraph calling band 8354-8374 kHz of which 8364 kHz is the center frequency. Stations receiving a call in the 8 MHz band will normally reply on the frequencies indicated.

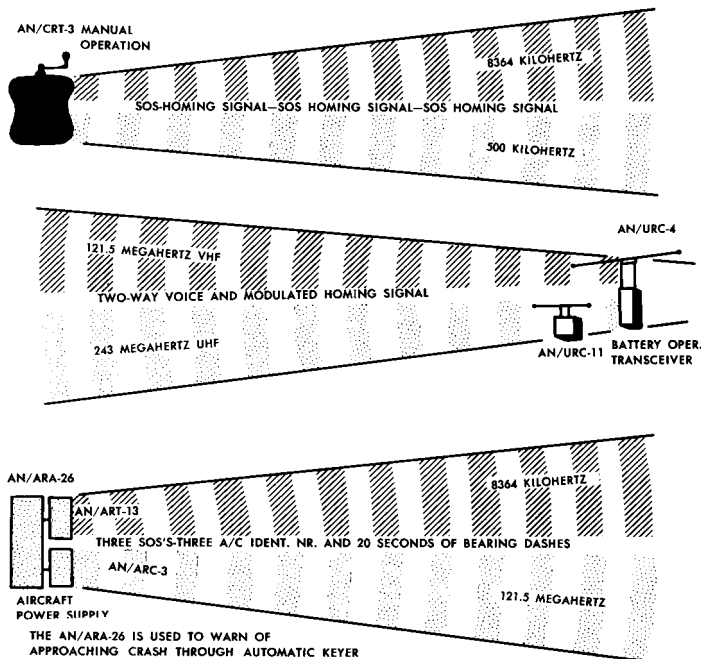

Activity	Call	Answering Freq
Adak	NOX	8465
Ketchikan	NMJ	8728
San Francisco	NMC	8465

IV. EMERGENCY RADIO SIGNALS

Whenever a plane is assumed to be in distress it is the duty of all aircraft in flight to listen for emergency radio signals. Ascertain from Operations what frequencies are most likely to be received. Check all emergency frequencies as often as possible, especially at the above times. Operating frequencies of currently standard emergency transmitters are shown below.

International silence periods are observed on 500kHz from 15 to 18 and 45 to 48 minutes past the hour. In ITU Regions 1 and 3 (except Japan and The Philippines), silence periods are observed on 2182kHz from 00 to 03 and 30 to 33 minutes past the hour. Distress calls, when transmitted on these frequencies, will have a better chance of being intercepted during these periods.

EMERGENCY RADIO SIGNALS OPERATING FREQUENCIES

V. AIRCRAFT WITNESSING DISTRESS

- A. When a pilot in command observes that another aircraft or a surface craft is in distress, he shall, unless unable to do so, or, in the circumstances of the case considers it unreasonable or unnecessary: (NOTE: each ICAO contracting state shall ensure that wreckage resulting from aircraft accidents within its territory is removed, obliterated, or charted to prevent subsequent confusion).
 1. Keep distressed craft in sight until his presence is no longer necessary or he is no longer able to remain in the vicinity.
 2. If his position is not known with certainty, take such action as to determine it.
 3. Report to the rescue coordination center or air traffic services unit, as much of the following information as possible.
 - a. Type of craft in distress, its identification and condition.
 - b. Time of observation expressed in UTC on the 24 hour system.
 - c. Number of persons observed.
 - d. Whether persons have been seen to abandon distressed craft.
 - e. Number of persons observed to be afloat.
 - f. Apparent physical condition of survivors.
 4. Act as instructed by the rescue coordination center.
- B. If the pilot in command of the first aircraft to reach the place of the accident is unable to establish coordination with the rescue coordination center or air traffic services unit, he shall take charge of activities of all other aircraft to arrive until such time as by mutual agreement he hands over responsibility to that aircraft best able to provide communication under the prevailing circumstances.
- C. Whenever a distress call and/or message is intercepted on radiotelegraphy or radiotelephony by a pilot in command of an aircraft, other than a search aircraft, he shall:
 1. Plot the position of the craft in distress, if given.
 2. If possible, take a bearing on the transmission.
 3. At his discretion, while awaiting instructions, proceed to the position given in the distress signal.

NOTE: In addition, compliance is required with communications procedures.
- D. When it is necessary for an aircraft to direct a surface craft to the place where an aircraft or surface craft is in distress, the aircraft shall do so by transmitting precise instructions by any means at its disposal. When this is not possible, the following procedure shall be used:
 1. Circle the surface craft at least once.
 2. Cross the projected course of the surface craft close ahead, at a low altitude, opening and closing the throttle or changing the propeller pitch.
 3. Heading in the direction in which the surface craft is to be directed.
 - E. Crossing the wake of the surface craft, close astern, at a low altitude, opening and closing the throttle or changing the propeller pitch shall mean that the assistance of the surface craft to which the signal is no longer required.
- F. Current maritime signaling procedures include:
 1. For acknowledgment of receipt of signal:
 - a. Hoisting of the "Code Pennant" (vertical red and white stripes) close up, (meaning understood).
 - b. The flashing of a succession of "T's" by signal lamp in Morse code.
 - c. The changing of heading.
 2. For indicating the inability to comply:
 - a. Hoisting of the international flag "N" (a blue and white checkered square).
 - b. The flashing of a succession of "N's" in the Morse code.

VI. AIR/GROUND EMERGENCY SIGNALS

A. STANDARD AIRCRAFT ACKNOWLEDGEMENTS

MESSAGE RECEIVED AND UNDERSTOOD:
Aircraft will indicate that ground signals have been seen and understood by —

DAY OR MOONLIGHT: Rocking from side to side.

NIGHT: Making green flashes with signal lamp.

MESSAGE RECEIVED AND NOT UNDERSTOOD:
Aircraft will indicate that ground signals have been seen but not understood by —

DAY OR MOONLIGHT: Making a complete right hand circle.

NIGHT: Making red flashes with signal lamp.

B. BODY SIGNALS

INSTRUCTIONS: If you are able to attract the attention of the pilot of a rescue airplane, the body signals illustrated below can be used to transmit messages to him as he circles over your location. Stand in the open when you make the signals. Be sure that the background, as seen from the air, is not confusing. Go through the motions slowly and repeat each signal until you are positive that the pilot understands you.

EMERGENCY SIGNALS
GROUND-AIR VISUAL CODE FOR USE BY SURVIVORS

No.	MESSAGE	CODE SYMBOL
1	Require assistance	✓
2	Require medical assistance	X
3	No or Negative	N
4	Yes or Affirmative	Y
5	Proceeding in this direction	↑

If in doubt use International symbol **S O S**

GROUND-AIR VISUAL CODE FOR USE BY GROUND SEARCH PARTIES

NO	MESSAGE	CODE SYMBOL
1	Operation completed	L L L
2	We have found all personnel	<u>L L</u>
3	We have found only some personnel	++
4	We are not able to continue, Returning to base	X X
5	Have divided into two groups, Each proceeding in direction indicated.	
6	Information received that aircraft is in this direction	
7	Nothing found, Will continue search.	N N

1. INSTRUCTIONS

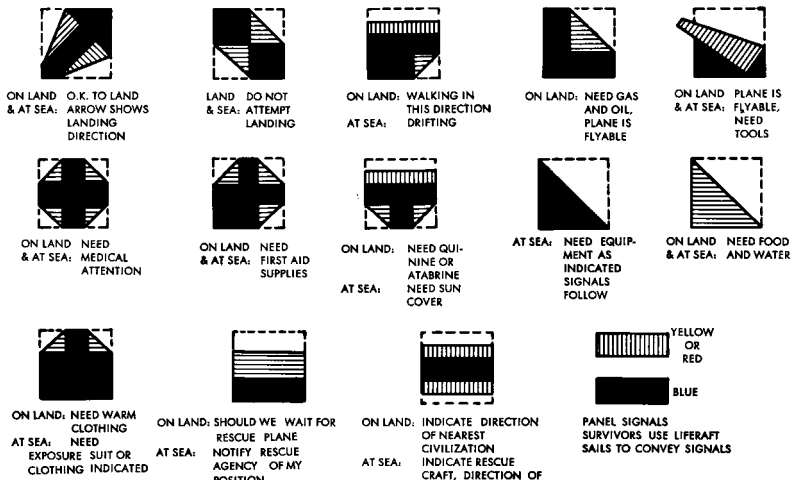

- a. Lay out symbols by using strips of fabric or parachutes, pieces of wood, stones, or any available material.
- b. Provide as much color contrast as possible between material used for symbols and background against which symbols are exposed.
- c. Symbols should be at least 10 feet high or larger. Care should be taken to lay out symbols exactly as shown.
- d. In addition to using symbols every effort is to be made to attract attention by means of radio, flares, smoke, or other available means.
- e. On snow-covered ground, signals can be made by dragging, shoveling or tramping. Depressed areas forming symbols will appear black from the air.
- f. Pilot should acknowledge message by rocking wings from side to side.

486 EMERGENCY PROCEDURES

D. PAULIN SYMBOLS

INSTRUCTIONS: Either USAF or USN paulins may be used to form signals. The paulins are blue on one side and yellow or red on the other. They are held down with rocks, stones, or pegs. In life rafts, lines are tied to grommets to facilitate holding. Wood may be tied to edge and floated in center of small lakes or slow rivers.

PAULIN SIGNAL DIAGRAM

NOTES: (1) It is preferable to use the International Ground Air Emergency Code. The symbols can be made larger and hence more recognizable from the air.

(2) Paulins should be folded to form the signals shown on this page. A paulin is an extremely valuable shelter, poncho, floor cloth, sleeping bag cover, sunshade, or rain collector.

VII. IN-FLIGHT TECHNICAL ASSISTANCE

A. ANY US MILITARY AIRCRAFT requiring inflight technical assistance may use the communications and/or command and control facilities listed below.

B. Air National Guard (ANG) Operations center at Andrews AFB may be contacted by phone patch through any Global HF System Station (See DOD Enroute Flight Information handbook (FIH) Section B). Request the ANG Operations Center (call sign MINUTEMAN) DSN 858-6001 or 1-800-237-9744.

C. Air Mobility Command (AMC) Operations Centers may be contacted as described in Global HF System Stations (FIH, Section B).

D. Air Combat Command (ACC) Command Posts may be contacted by calling "GOLDEN" on 381.3 MHz. An ACC Post will answer with its respective call sign. In addition, ACC Posts may be contacted by phone patch through any Global HF System Station (FIH, Section B) or the Western Space and Missile Center (WSMC) HF net. The WSMC HF net (call sign "ABNORMAL ONE ZERO") located at Vandenberg AFB, CA or call sign "ABNORMAL TWO ZERO" located at Wheeler AFB, HI) may be contacted on USB frequencies 5700 and 13218 KHz. HQ ACC Post can be contacted at DSN 574-7771/2224.

VIII. RECOMMENDED PROCEDURES FOR ANY EMERGENCY PHASE (UNCERTAINTY — ALERT — DISTRESS — LOST)

A. If flying at low altitude climb if possible to increase chance of radio or radar contact. (Permitted in emergency only if IFR in controlled airspace.)

B. If equipped with "IFF", switch to "EMERGENCY". If equipped with SIF, set master code control to "EMERGENCY", Mode 3 switch in, Mode 3 dial code 77 (new code 7700). NOTE: The pilot should understand that he may not be within a radar coverage area and that, even if he is, certain radar facilities are not yet equipped to automatically recognize "EMERGENCY" and Code 7700 as emergency signals. Therefore, he should establish radio communication with an air traffic control facility as soon as possible.

- C. If time permits, contact controlling agency and give nature of distress and pilot's intentions.
- D. If unable to contact controlling agency, transmit following distress message to any agency on assigned or any of the frequencies listed.

UHF/VOICE	VHF/VOICE	MF/VOICE	HF/CW	MF/CW
243.0 MHz	121.5 MHz	2182 kHz	*8364 kHz	500 kHz

*Canadian facilities excepted.

NOTE—Direct controller-to-pilot communications capability 121.5/243.0 MHz is limited to the area (dependent upon the location/altitude of the aircraft) within the vicinity of the ARTC Center since these frequencies are installed for center use at the local ARTC Center transmitting/receiving site only. If the ARTCC does not respond to transmission on emergency frequency 121.5 MHz or 243.0 MHz pilots should initiate a call to the nearest Flight Service Station or airport traffic control tower.

1. a. VOICE** PAN or MAYDAY (3 times) THIS IS (aircraft call sign 3 times).
b. CW*** XXX or SOS (3 times) DE (aircraft call sign 3 times).
2. TYPE OF AIRCRAFT
3. POSITION or ESTIMATED POSITION (state which) and TIME (When geographic coordinates are used, express latitude and longitude in "degrees and minutes".)
4. HEADING (state true or magnetic)
5. INDICATED AIRSPEED
6. ALTITUDE
7. FUEL REMAINING (in hours and minutes)
8. NATURE OF EMERGENCY
9. PILOT'S INTENTIONS (bail out, ditching, crash landing, etc.)
10. ASSISTANCE DESIRED (fix, steer, bearing, escort, etc.)
11. TWO 10-SECOND DASHES (voice — depress mike button. CW — by key) AIRCRAFT CALL SIGN (once) OVER (voice) or K (CW)

(When contact established comply with instructions. Accept "communications control" by ground station, silence interfering stations, do not shift frequency or ground stations unless necessary.)

**Use PAN (voice) or XXX (CW) when your situation requires urgent action, but is not actual distress. Use MAYDAY (voice) or SOS (CW) when you are threatened by serious or imminent danger and you require immediate assistance.

IX. RECOMMENDED PROCEDURES FOR AIRCRAFT IN DISTRESS WHEN INTERCEPTED

- A. Attempt radio contact, if possible.
- B. If able to maintain a minimum of 210 knots, get in trail formation and the interceptor will lead you to the nearest suitable airport.
- C. If unable to maintain a minimum of 210 knots, the interceptor will fly in the direction you should fly, circle to the left and again fly in the proper direction. This procedure will be repeated until the area for descent is reached. The interceptor will circle to the right over the area where you should descend. The distressed aircraft should let down in a descending turn at minimum rate of descent.

X. RECOMMENDED PROCEDURES FOR THE INTERCEPTOR AFTER INTERCEPTION

- A. Reduce speed for formation flight or maximum endurance, as required.
- B. Attempt radio contact, if possible.
- C. Inform controller of contact and follow his instructions.
- D. If distressed aircraft can maintain minimum of 210 knots, lead him to suitable airport as directed by the controller.
- E. If distressed aircraft cannot maintain 210 knots, lead the aircraft, as recommended in IX. C above, to the location directed by the controller.
- F. If the interceptor must leave the distressed aircraft:
 - (1) If the interceptor turns his lights from steady to blinking for 15 seconds, then breaks formation with lights blinking (night) or wings rocking (day), the distressed aircraft should continue on course.
 - (2) If the interceptor turns his lights from steady to blinking for 30 seconds, then back to steady and breaks formation with lights on steady (night) or fishtails (day), the distressed aircraft should resume distress orbit.

In support of the Federal Aviation Administration's Runway Incursion Program, selected towered airport diagrams have been published in the Airport Diagram section of the A/FD. Diagrams will be listed alphabetically by associated city and airport name. Airport diagrams, depicting runway and taxiway configurations, will assist both VFR and IFR pilots in ground taxi operations. The airport diagrams in this publication are the same as those published in the U.S. Terminal Procedures Publications. For additional airport diagram legend information see the U.S. Terminal Procedures Publication.

NOTE: Some text data published under the individual airport in the front portion of the A/FD may be more current than the data published on the Airport Diagrams. The airport diagrams are updated only when significant changes occur.

GENERAL INFORMATION

PILOT CONTROLLED AIRPORT LIGHTING SYSTEMS

Available pilot controlled lighting (PCL) systems are indicated as follows:

- 1. Approach lighting systems that bear a system identification are symbolized using negative symbology, e.g., , , .
- 2. Approach lighting systems that do not bear a system identification are indicated with a negative "0"  beside the name.

A star (★) indicates non-standard PCL, consult the individual airport in the front portion of the A/FD, e.g., ★
To activate lights use frequency indicated in the communication section of the chart with a  or the appropriate lighting system identification e.g., UNICOM 122.8 , , 

<u>KEY MIKE</u>	<u>FUNCTION</u>
7 times within 5 seconds	Highest intensity available
5 times within 5 seconds	Medium or lower intensity (Lower REIL or REIL-off)
3 times within 5 seconds	Lowest intensity available (Lower REIL or REIL-off)

CHART CURRENCY INFORMATION

The Chart Date identifies the Julian date the chart was added to the volume or last revised for any reason. The first two digits indicate the year, the last three digits indicate the day of the year (001 to 365/6) in which the latest addition or change was first published.
The Procedure Amendment Number precedes the Chart Date, and changes any time instrument information (e.g., DH, MDA, approach routing, etc.) changes. Procedure changes also cause the Chart Date to change.

MISCELLANEOUS

- ★ Indicates a non-continuously operating facility, see the individual airport in the front portion of the A/FD.
- # Indicates control tower temporarily closed UFN.

08325
LEGEND

INSTRUMENT APPROACH PROCEDURES (CHARTS)

AIRPORT DIAGRAM/AIRPORT SKETCH

Runways

ARRESTING GEAR: Specific arresting gear systems; e.g., BAK12, MA-1A etc., shown on airport diagrams, not applicable to Civil Pilots. Military Pilots refer to appropriate DOD publications.

REFERENCE FEATURES

When Control Tower and Rotating Beacon are co-located, Beacon symbol will be used and further identified as TWR.

Runway length depicted is the physical length of the runway (end-to-end, including displaced thresholds if any) but excluding areas designated as stopways.

A **D** symbol is shown to indicate runway declared distance information available, see appropriate A/FD, Alaska or Pacific Supplement for distance information.

Runway Weight Bearing Capacity/or PCN Pavement Classification Number is shown as a codified expression.

Refer to the appropriate Supplement/Directory for applicable codes e.g., RWY 14-32 S75, T185, ST175, IT325 PCN 80 F/D/X/U

Helicopter Alighting Areas

Negative Symbols used to identify Copter Procedures landing point.....

Runway TDZ elevation.....TDZE 123

Runway Slope..... 0.3% DOWN
 0.8% UP
 (shown when runway slope is greater than or equal to 0.3%)

NOTE:

Runway Slope measured to midpoint on runways 8000 feet or longer.

U.S. Navy Optical Landing System (OLS) "OLS" location is shown because of its height of approximately 7 feet and proximity to edge of runway may create an obstruction for some types of aircraft.

Approach light symbols are shown in the Flight Information Handbook.

Airport diagram scales are variable.

True/magnetic North orientation may vary from diagram to diagram

Coordinate values are shown in 1 or ½ minute increments. They are further broken down into 6 second ticks, within each 1 minute increments.

Positional accuracy within ±600 feet unless otherwise noted on the chart.

NOTE:

All new and revised airport diagrams are shown referenced to the World Geodetic System (WGS) (noted on appropriate diagram), and may not be compatible with local coordinates published in FLIP. (Foreign Only)

SCOPE

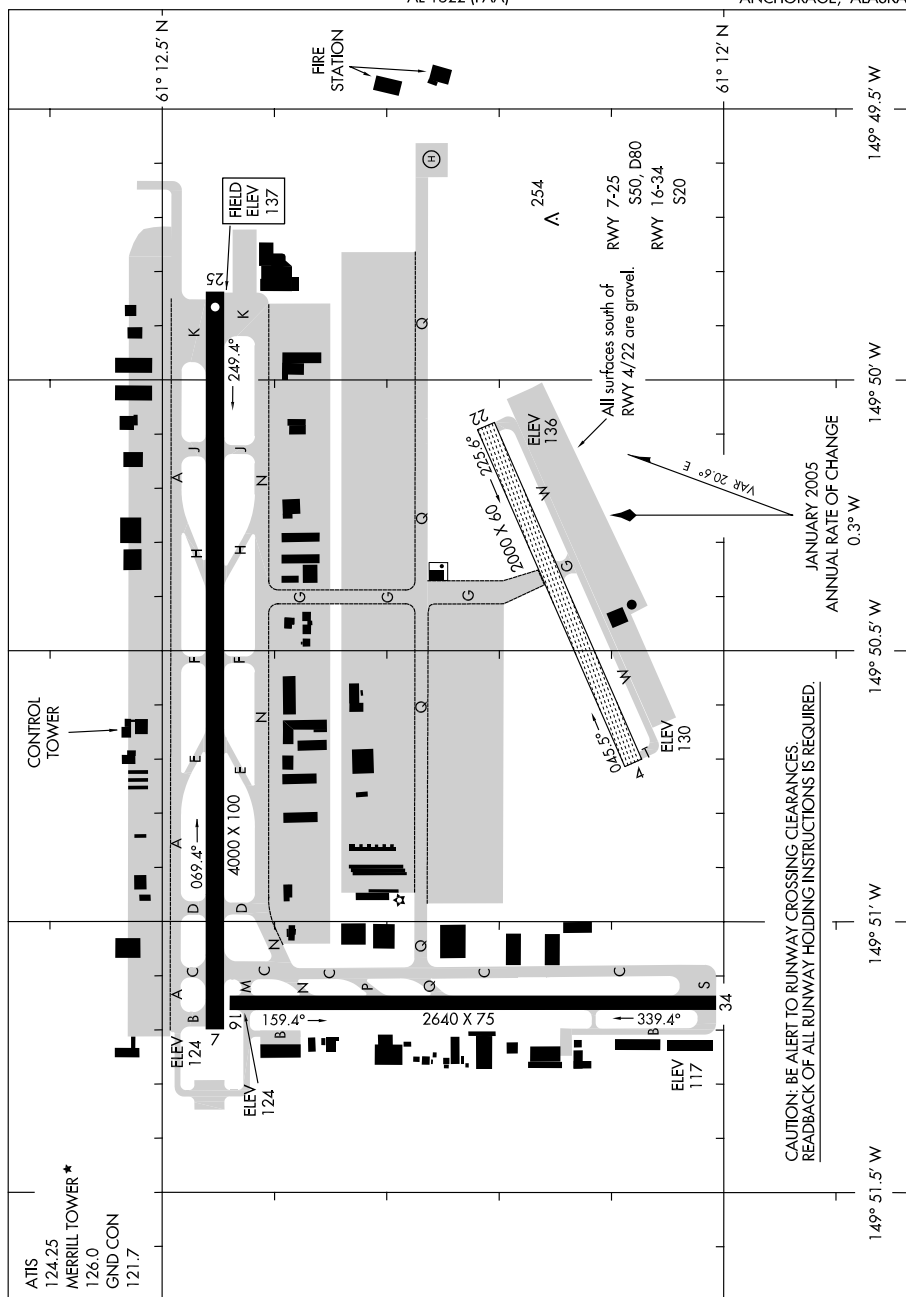

Airport diagrams are specifically designed to assist in the movement of ground traffic at locations with complex runway/taxiway configurations and provide information for updating Computer Based Navigation Systems (I.E., INS, GPS) aboard aircraft. Airport diagrams are not intended to be used for approach and landing or departure operations. For revisions to Airport Diagrams: Consult FAA Order 7910.4.
